## Abstract

The phonology, morphology and semantics of six Northern Chin languages are investigated in terms of their relationships with Old Burmese and Old Chinese. Regular correspondences are achieved through a vertical two vowel system and a segmentally derived three tone system. A word list with reconstructed Northern Chin forms, of which several are used in the comparisons with Old Burmese and Old Chinese throughout the work, is included as an appendix.

## Table of Contents

List of Sino-Tibetan Roots ..... 11
Symbols ..... 12
Conventions ..... 13
Abbreviations ..... 15
Preface ..... 17
Chapter 1: Northern Chin Overview ..... 19
1.1 Subgrouping ..... 19
1.2 Nomenclature ..... 20
1.2.1 Mizo ..... 21
1.2.2 Zahau ..... 22
1.2.3 Thado ..... 22
1.2.4 Zo ..... 22
1.2.5 Tedim ..... 23
1.2.6 Sizang ..... 23
1.3 Data Sources ..... 23
1.4 Northern Chin Rhymes ..... 26
1.4.1 Diphthongs ..... 27
1.4.2 Codas ..... 30
1.4.2.1 Zahau -ow? / -ew? ..... 30
1.4.2.2 Glide Codas and Syllable Weight ..... 30
1.4.2.3 Thado - $?$ and Syllable Weight ..... 32
1.4.2.4 Zo -? / -a ..... 33
1.5 Initials ..... 33
1.5.1 Alveolars versus Dentals ..... 34
1.5.2 Luce's ${ }^{\prime} g$ - ..... 35
1.5.3 $\mathrm{Zo}^{h} l$ - and $h$ - ..... 35
1.5.4 Voiced Fricatives ..... 35
1.5.5 Zahau ?- ..... 36
1.6 Tones ..... 36
1.6.1 Tone I ..... 37
1.6.2 Tone II ..... 38
1.6.3 Tone III ..... 39
Chapter 2: Old Burmese ..... 40
2.1 Vocalism ..... 40
2.1.1 Three Vowel $i / u / a$ System ..... 40
2.1.2 Two Vowel i/a System ..... 42
2.1.3 Two Vowel i/a System ..... 43
2.1.3.1-ik/-ij versus -ac /-an ..... 43
2.1.3.2 Reanalysis of $i$ as $\dot{i}$ ..... 44
2.1.3.3 Palatal Rhymes -wac and -wan ..... 45
2.1.4. The Rhymes of Old Burmese ..... 46
2.2 Pure Initials ..... 47
2.3. Medials ..... 48
2.3.1 Medials $-j$ - and -w- ..... 48
2.3.1.1 Inscriptional Burmese $\eta$ - and Written Burmese $\eta r$ - ..... 49
2.3.1.2 Inscriptional Burmese $r j$ - and Written Burmese $r$ - ..... 50
2.3.1.3 Old Burmese $c j$ - and Inscriptional/Written Burmese $c$ - ..... 50
2.3.1.4 Old Burmese $n j$ - $t j$ - and Inscriptional/Written Burmese $n-/ c-51$
2.3.1.5 Inscriptional Burmese ${ }^{h} j-/ h j-/ s j$ - and Written Burmese ${ }^{h} r$ - ..... 51
2.3.2 Medials $-l$ - and $-r$ - ..... 52
2.3.2.1 Inscriptional Burmese $-l$ - and Written Burmese $-j$ - $/-r-$ ..... 52
2.3.2.2 Inscriptional Burmese -lj- ..... 53
2.4 Tonality ..... 53
2.4.1 Suffixal - ? and $-s$ ..... 53
2.4.2 Prefixal $s$ - ..... 55
Chapter 3: Old Chinese ..... 57
3.1 Vocalism ..... 57
3.1.1 Baxter's Six Vowel and Li's Four Vowel System ..... 57
3.1.2 Pulleyblank's Two Vowel System ..... 59
3.2 Codas ..... 60
3.2.1 Laterals ..... 61
3.2.2 Palatals ..... 61
3.2.3 Velar Glides ..... 62
3.2.4 Labiovelars ..... 63
3.2.5 Uvulars ..... 64
3.3 Tonality ..... 65
3.3.1 Tone III from -s ..... 65
3.3.2 Tone II from -? ..... 66
3.4 Type A and B Syllables ..... 67
3.5 Initials ..... 68
3.5.1 Pure Initials ..... 69
3.5.2 Prefixes ..... 70
3.5.2.1 Prefixal $k$ - ..... 70
3.5.2.2 Prefixal $r$ - ..... 71
3.5.2.3 Prefixal $s$ - versus Sagart's $N$ - and Pulleyblank's $a_{\text {- }}$ ..... 72
Chapter 4: Northern Chin Initials ..... 74
4.1 Velars ..... 75
4.2 Velar Clusters ..... 77
4.2.1 Velar Clusters with $r$ - ..... 79
4.2.2 Velar Clusters with $l$ - ..... 82
4.3 Rhotics ..... 84
4.3.1 Confusion of Northern Chin $*^{h} r$ - and ${ }^{*} r$ - ..... 87
4.4 Laterals ..... 88
4.5 Affricates ..... 89
4.5.1 Unaspirated ..... 89
4.5.2 Aspirated ..... 92
4.6 Sibilant $s$ - ..... 93
4.6.1 Affricate Source ..... 93
4.6.2 Benedict's *sj- Hypothesis ..... 94
4.7 Dentals ..... 95
4.7.1 Unshifted ..... 95
4.7.2 Sibilant in Origin ..... 97
4.8 Glides ..... 98
4.8.1 Labiovelar $w$ - ..... 98
4.8.2 Palatal $j$ - ..... 99
4.9 Bilabials ..... 102
4.9.1 Unshifted ..... 102
4.9.2 Lenition to $w$ - ..... 103
4.10 Glottals ..... 104
4.10.1 Unshifted ?- ..... 104
4.10.2 Peiros \& Starostin's Uvular Hypothesis ..... 106
Chapter 5: Northern Chin Rhymes ..... 111
5.1 Open Rhymes ..... 112
5.1.1 High Vowels $-i$ and $-u$ ..... 112
5.1.2 Low Vowel - $a$ ..... 114
5.1.3 Mid-vowels $-e$ and - $o$ and Diphthongs -I $a$ and $-v a$ ..... 116
5.1.3.1 Prefix Induced Diphthongs ..... 120
5.2. Closed Syllables ..... 121
5.2.1 Unshifted ..... 121
5.2.1.1 Pure Vowel ..... 121
5.2.1.2 Medial -j- ..... 124
5.2.1.3 Medial -w- ..... 127
5.2.2 Coda $-j$ ..... 128
5.2.2.1 Rhyme $-\varepsilon j$ ..... 130
5.2.2.2 Rhyme -aj ..... 134
5.2.3 Coda - $w$ ..... 135
5.2.3.1 Rhyme -ow ..... 135
5.2.3.2 Rhyme -aw ..... 137
5.2.3.3 Sino-Tibetan -15 ..... 138
5.2.4 Liquid Codas ..... 139
5.2.4.1 Rhotic -r ..... 139
5.2.4.2 Lateral -l ..... 141
5.2.5 High Vowel $\mathrm{I} / i$ before $-k / \eta$ and $-t / n$ ..... 143
5.2.5.1 Matisoff's Bilabial Coronalisation after $\mathrm{I} / i$ ..... 148
5.2.6 High Vowel $v / u$ before $-k / \eta$ ..... 149
5.2.7 Final - ? / - III ..... 150
Chapter 6: Northern Chin Tones ..... 153
6.1 Tones IIa and IIb ..... 155
6.2 Shift of $-\eta^{I I}$ to $-k$ ..... 157
6.3 Northern Chin $-m y^{I I}$ and Old Chinese $-2 y^{I}$ ..... 159
6.4 Tone II Nouns ..... 161
6.5 Loanwords and Tonal Discrepancies ..... 165
6.5.1 Benedict's $s$ - Hypothesis ..... 165
6.5.2 Benedict's - $n$ Hypothesis ..... 165
6.5.3 Kinship Terms ..... 166
6.5.4 Loanwords ..... 169
Chapter 7: Northern Chin Morphology ..... 182
7.1 Verbal Inflections ..... 182
7.1.1 Stopped Syllable Variation in Tedim and Sizang ..... 183
7.1.2 Open Syllable Variation in tone II ..... 183
7.1.3 Origin in Suffixal -s ..... 186
7.1.3.1 Glottality ..... 187
7.1.3.2 Open Syllables and $-t /-k$ ..... 188
7.1.4 Superadded $-s$ Suffixation ..... 188
7.1.5 Causativity Paradigms ..... 189
7.2 Superficial Irregularities ..... 194
7.2.1 Reduction of Causativity Paradigms ..... 194
7.2.2 Alternations of $-k$ and $-t$ ..... 196
7.2.3 Alternation of $-\partial ? /-o^{\text {ilf }}$ and $-\partial w ? /-\partial w^{\text {III }}$ ..... 197
7.3 Nominalisation ..... 197
7.4 Initial Aspiration ..... 199
7.5 Allofamy ..... 200
7.5.1 Consonants ..... 200
7.5.2 Vowels ..... 202
7.5.2.1 The $\varepsilon / a$ and $\varepsilon / e$ Ablaut ..... 205
7.5.2.2 Other Cases ..... 206
Chapter 8: Concluding Remarks ..... 209
8.1 Lexical Diffusion ..... 209
8.1.1 External Conditioning ..... 210
8.1.2 Internal Conditioning ..... 211
8.2 Vowelless Languages ..... 211
8.2.1 Indo-European ..... 212
8.2.2 Northwest Caucasian ..... 213
8.2.2.1 Abaza ..... 213
8.2.2.2 Kabardian ..... 213
8.2.3 Indo-European versus Sino-Tibetan ..... 215
Appendix: Northern Chin Word List ..... 216
Bibliography ..... 373

## Symbols

* Precedes a reconstructed form; the standard practice of not using an asterisk before Middle Chinese forms is adopted here and further extended to Old Burmese due to its similarly strong textual foundation.
** Precedes a speculative reconstructed form.

Precedes a Type B syllable in Old Chinese.
$>\quad$ Identifies the immediately following form as a derivative of the immediately preceding one.
$<\quad$ Identifies the immediately preceding form as a derivative of the immediately following one.
~ Separates a Northern Chin form 1 from its inflected form 2.
/ Separates alternative forms whether in free variation or complementary distribution.
$\approx \quad$ Signifies 'allofamic' variation as coined by Matisoff (1978a:16-7) and discussed in 7.5 ; usage is confined to when citing roots reconstructed by Matisoff.

- Denotes a missing initial or rhyme unless preceding or following a whole morpheme in which case it denotes its position in a compound.
- Underlines an irregular correspondence in the word list.
$\square$ Encloses the gloss of a suspected loanword or onomatopoeic word in the word list.

## Conventions

## i. Transcriptions

The proposals of the International Phonetic Association (IPA) are generally followed throughout the work. Excluding the following three cases, exceptional cases are noted with the IPA transcription between square brackets as '[ ]':
e Treated in the same relationship to $\varepsilon$ as $i$ to $I$ and $u$ to $v$. Consequently, the modern Burmese open rhyme [e] is not distinguished in the transliteration here from the diphthong $e_{I}$ such that IPA [e], [eñ], [er?] are treated as eI, eif, er?.
o Treated in the same relationship to $\partial$ as $i$ to $I$ and $u$ to $v$. Consequently, the modern Burmese open rhyme [ o ] is not distinguished in the transliteration here from the diphthong ou such that IPA [o], [oũ], [ov?] are treated as ov, oõ, ou?.

1 The modern Mandarin vowel corresponding to IPA [z] after alveolar affricates and fricatives or [ z$]$ after retroflex affricates and fricatives.

## ii. Spectrograms

s Seconds (on the horizontal axis)
kHz Kilohertz (frequency on the left axis; pitch on the right axis)

## iii. Appendix (Northern Chin Word List)

Generally only one root is reconstructed for cases of vocalic ablaut and this usually favours the most common variant. The distinction of suffixal $-s$ on an original obstruent coda and root final $-s$ is not always clear with root final $-s$ being posited in all cases where suffixal evidence is not forthcoming at present. The following alphabetical arrangement is used:

Consonants: $\quad 2-, b-, d-, d z-, h-, j-, k-, k^{h}-, k l-, k^{h} l-, k r-, k^{h} r-, l-,{ }^{h} l-, m-,{ }^{h} m-, n-,{ }^{h} n-, \eta-$, ${ }^{h}{ }_{y-}, p-, p^{h}-, r_{-},{ }^{h} r_{-}, s-, t-, t^{h}-, t s-, t s^{h}-, w-$

Vowels: $\quad \mathcal{e}, a, \varepsilon, e, \mathrm{I}, i, \nu, o, v, u$

## iv. Orthographic Forms:

Burmese and Chinese orthographic forms are generally noted after their modern transcriptions in Standard Burmese, as defined in Nishi (1998:257), or Mandarin Chinese respectively. Distinct Inscriptional Burmese forms are noted, where applicable, directly after the Written Burmese forms from which they are separated by a forward slash ' $/$ '. Early Middle Chinese forms, as reconstructed in Pulleyblank (1991b), ${ }^{1}$ and Old Burmese forms are noted directly after their respective native orthographic forms. Old Chinese forms are separated from Early Middle Chinese ones with a backwards arrow ' $<$ '.

## Preface

The Northern Chin, Old Burmese and Old Chinese comparisons presented here are generally from the works of Matisoff with supplementary insights afforded predominantly by Peiros \& Starostin (1996). An attempt has been made to discuss all of the Northern Chin forms presented in the works of Matisoff which should allay any concerns regarding cherry-picking of the data. ${ }^{2}$ Although new comparative forms are rarely introduced, it is hoped that the establishment of regular phonological correspondences in this work will greatly facilitate such a task in the future.

Matisoff's and Peiros \& Starostin's reconstructed Tibeto-Burman and Sino-Tibetan roots are noted at the top of every proposed comparative set. ${ }^{3}$ The term TibetoBurman is noted by Matisoff (1991b:472) to have been applied in the 1850s to a group of related languages, including Northern Chin, with the name stemming from the value attached to the extensive, and still extant, literary traditions of Tibetan and Burmese. The term Sino-Tibetan seems to have been first used by Kroeber in his editorial forward to Shafer (1938), although the first meaningful discussion appears in Shafer's response (1940:302) to Maspero's queries (1938:206) regarding its validity. The term Sino-Tibetan is used here in accordance with the generally accepted notion ${ }^{4}$ of a genetic relationship between the Chinese and Tibeto-Burman languages; no position is adopted here regarding the various approaches towards the exact nature of this association. ${ }^{5}$

The terms Burma and Burmese will be used in preference to Myanmar with the term Burman being applied exclusively to the majority ethno-linguistic group of Burma unless occurring in the compound Tibeto-Burman. In a work such as this on historical linguistics, it seems appropriate to note that the terms Burma (bama ${ }^{1} 065$ ) and
 In his study of Tavoyan Burmese, Okell (1995:105-6) notes a common interchange of Standard Burmese $m j$-, when derived from Old Burmese $m r$-, with Tavoyan $b j$-; he

[^1]cites one inverse example of Standard Burmese $b j$ - and Tavoyan $m r$ - to further suggest that a similar shift may perhaps be reflected in the names Burma and Myanmar. The Written Burmese form for bəma ${ }^{1}$ ט $\ddots \supset$ supports such a proposal with the voiced initial not belonging to the Old Burmese phonological system, ${ }^{6}$ yet an account is still required for the $-n$ coda in the first syllable of mjan'ma' ${ }^{1} \$(6)$ for which the orthography suggests mran ${ }^{1} \mathrm{ma}^{1}$. The solution is provided by Luce's observation (1959b:53) that the $-n$ coda is not always present in Inscriptional Burmese where it also occurs as $\Theta_{0}^{\circ} \propto \infty$ mram'ma'.

[^2]
## Chapter 1: Northern Chin Overview

"I was brought up to regard Far Eastern languages generally as (i) Monosyllabic (consisting of words of one syllable); (ii) Invariable (not modified by any inflexions); and (iii) Isolating (destitute of syntax). Chin is a language which disproves all three statements."

- G. H. Luce (1959a:30)

Broad generalisations Luce's remarks may be, but even in today's more informed linguistic environment, the verbal inflections and surface vocalic length distinctions ${ }^{7}$ of many Chin languages pit them against the norm for members of the Sino-Tibetan language family. The study here focuses on a reconstruction of the phonology and morphology of Northern Chin based on a closely related group of languages, spoken in the Chin Hills on the Burmese side of the border with India. Specific attention is paid to external comparisons with Old Burmese, as attested in inscriptions, ${ }^{8}$ and Old Chinese. ${ }^{9}$ To compare evidence of such different time depths may seem anachronistic, but the unique insights afforded reveal striking typological similarities with the conservative Northern Chin languages that have not succumbed as easily to time's gentle erosion as have the modern Burmese or Chinese languages.

### 1.1 Subgrouping

Bradley (1997:26-31, 2002:90-1) splits off a Central Chin group from what is classified here as Northern; Peiros (1998:180) treats Bradley's Northern and Central branches as one which represents the approach adopted here. Peterson (2000:79;95), who focuses in particular on the evolution of the $r$ phoneme (2000:81-5) and on shared morphosyntactic traits (2000:85-95), retains Bradley's distinction of a Central group but fuses his Northern and Southern groups together. Particularly as regards

[^3]Southern Chin evidence, a thorough discussion of such subgrouping issues is beyond the scope of this work. While the phonological and morphological evidence to be presented here shows Bradley's division of a Central Chin group to be not simply a geographical one, the overwhelming similarity between these Central languages and their more Northern counterparts, particularly in terms of degrees of mutual intelligibility as opposed to the Southern ones, supports the clumping of them together at least for the purposes of this exposition.

### 1.2 Nomenclature

The term used by Northern Chins to refer to themselves is customarily transliterated as $Z o$ which may be reconstructed in Northern Chin as *jow. The name Chin is
 term Kuki on the Indian side of the border which Lehman (1963:5) suggests to be Manipuri in origin. ${ }^{11}$ The Chin are unequivocally attested in some of the later Burmese inscriptions:

Thet Mrun ${ }^{12}$ Chin PL rule ATTR... Arakan king SUbJ The Arakanese King... who ruled over the Thet, Mrun and Chin. ${ }^{13}$

Luce (1959a:25-6, 1959d:89, 1976:35, 1985:I.80) suggests the homophony shared with the Burmese word for companion, ally $n$ is due to a history of relative amicability between the Chins and the Burmans. However, if Luce's association (1959a:25, 1959c:60, 1985:I.86) of the Chin with the Chindwin valley is correct then earlier inscriptional evidence supports the reconstruction of an original medial $-l$ - in Chin as $\begin{gathered} \\ \mathcal{c} \\ k^{\mathrm{h}} \\ \text { lay }\end{gathered}{ }^{14}$

[^4]
## 

Chindwin ${ }^{16}$ from include ATTR slaves...
Slaves included from Chindwin...
The number of Chin languages spoken in Burma is difficult to quantify; Luce (1962a:2) suggests that his sampling of just over twenty northern and southern varieties may represent around half the actual number. Bradley (2007:168) suggests there to be around 550,000 speakers of Northern Chin languages in Burma; ${ }^{17}$ reliable figures for individual languages are mostly unavailable. The six Northern languages studied here may be viewed as generally spreading northwards from Zahau as the furthest south through to Sizang, Tedim, Zo and Thado in the North with Mizo flanking Zahau on the West. All six languages have missionary-based orthographies in which tone is never marked and surface vowel length is noted somewhat inconsistently if at all. Official orthographies for Zo and Sizang have only been established in recent years with projects to translate the Bible into their respective languages instead of having to rely on the Tedim standard. The languages are arranged in the following order in the data-set due to it reflecting the most natural layout in terms of phonological linkages between them.

### 1.2.1 Mizo

Lorrain (1940) terms this language Lushai as it is spoken in India. Luce (1959a:22) and Lehman (1963:16) distinguish the Burmese variety as Hualngo, although the more general term Mizo (milit ${ }^{\text {Ir }} \mathrm{zow}$ '), encompassing both the Indian and Burmese varieties, appears to be preferred. Bradley (2007:168) notes that the large numbers of speakers in India make Mizo the most widely spoken of all Chin languages. The comprehensiveness of Lorrain's work, in spite of its lack of tonal distinctions, has bestowed upon it the most attention in Tibeto-Burman studies. The speech recorded is that of a middle-aged man from ${ }^{h}$ mon $^{\text {"II }}$ laj' ${ }^{\text {i }}$ village.

[^5]
### 1.2.2 Zahau

Barely distinguishable from Laizo (laj ${ }^{j} z o w^{\prime \prime}$ ) with which comparisons are occasionally drawn in the data-set, Zahau ( za $^{\text {III }}{ }^{\text {haw }}{ }^{\text {III }}$ ) is often conflated with this and several other languages spoken in Falam (felam ${ }^{\text {III }}$ ) township under the general term Falam Chin. ${ }^{18}$ The name Laizo, composed of laj middle $n$ and a sandhi altered zow ${ }^{1} Z o$, should be carefully distinguished from Bradley's observation (2007:168) of a more generic usage of the term in reference to the many, often mutually unintelligible, languages within his Central Chin group. The first syllable Lai should also be differentiated from its individual use as the distinct language spoken in Hakha township south of Falam to which reference is occasionally made. The Zahau speech recorded here is that of a young woman from the central Falam area.

### 1.2.3 Thado

Sparsely represented in Burma, Thado ( $t^{\mathrm{h}} \mathrm{a}^{\mathrm{III}} \mathrm{dow}^{\mathrm{l}}$ ) is often referred to as Thado-Kuki to reflect its Indian base. Bradley (2007:168) notes it to be the largest Kuki language with over 50,000 speakers. Lehman (1963:5) suggests Thado speakers were pushed north into Manipur by Mizo speakers in the mid $19^{\text {th }}$ century. The speech recorded is that of a middle-aged man from soon" $p \varepsilon$ ? village. Reference is also made in 5.2.2 to Luce's observations (1959a:21, 1962c) regarding a northern variety of Thado, known as Xôngsai ${ }^{19}$ and found in Sagaing division outside the boundaries of Chin state, which provides interesting evidence concerning the evolution of lateral codas in Northern Chin.

### 1.2.4 Zo

Identical in name to that of the Chin people in general, the use of the term Zo (zow') in reference to a specific Chin language should be clearly distinguished in the same manner as the term Laizo above. It is spoken both in Tedim and Tonzang ( $\operatorname{ton}^{\mathrm{II}} \mathrm{zan}^{\text {² }}$ ) townships. The latter is the focus of the study here, although Luce (1962b) notes the Zo to be the original inhabitants of Tedim before being largely ousted by those now referred to as Tedim below. The speech recorded is that of a middle-aged man from en"lun' village in Tonzang township.

[^6]
### 1.2.5 Tedim

Often transliterated Tiddim, as it is found in Henderson (1965), Tedim ( trdim $^{\text {III }}$ ) is the language of the township that bears its name. Bradley (2007:167) notes the adoption of the township name for this language to have replaced the name Kamhau; Luce (1962b) more specifically notes this to have been the name of a $19^{\text {th }}$ century chieftain, whose very closely related Sokte dialect persists in a few nearby villages, who led his followers into Tedim and drove the original Zo speakers northwards. Tedim is the only Chin language that had started to develop an orthography before the arrival of missionaries in the early $20^{\text {th }}$ century. ${ }^{20}$ The speech recorded is that of a late middleaged man from $l \varepsilon j^{I I} l u m^{I}$ village. Reference is sometimes made in the data-set to Saizang (saj ${ }^{\text {II }} z a y^{\mathrm{I}}$ ) and Teizang ( $\mathrm{tcj}^{\mathrm{j}} \mathrm{zan}^{\mathrm{I}}$ ) on the basis of knowledge from Tedim speakers; both these languages are treated by Luce (1962a:5) and Henderson (1963:551) respectively as closely related dialects to Tedim.

### 1.2.6 Sizang

Confined to the Burmese side, Sizang (sitzay) is spoken in several scattered villages south of Tedim by a very small population. Stern (1963:224-5) notes the occasionally encountered name Siyin to be a transliteration of Standard Burmese $\mathrm{S}^{\mathrm{L}} \mathrm{i}^{\mathrm{I}} \tilde{\mathrm{j}}^{I I}$ ฉீ: adds that this small linguistic group rose to prominence as a result of their spirited resistance to the British colonial incursions into the Chin hills which later made them favoured recruits for colonial armies. The speech recorded is that of a middle-aged woman from $s u e \eta^{I I} d o^{I I}$ village, also known as $t e m^{\text {III }} d \varepsilon a n g^{I I I}$.

### 1.3 Data Sources

Reliable descriptions of Northern Chin languages are extremely scarce; the data presented here is from original fieldwork conducted in Burma during 2006-7. The transcriptions are based on recordings from a single individual native speaker for each

[^7]language made in a sound-proofed room in Rangoon; lexical elicitation, prior to recording, was conducted with several additional speakers who could verify the elicited vocabulary and occasionally provide variant forms. The original wordlist was based on morphemes for which solid Sino-Tibetan roots, replete with semantic and phonological variation, had been established in the literature. ${ }^{21}$ In this sense it was essentially a development of the proposals in Matisoff (1978a:133-47;283-96, 2000c) and Wilkins (1996) to find a culturally specific and semantically flexible means of elicitation. Naturally any attempt to rein in the data in this manner was only of limited effect such that the initial surveys of each language ended up being only broadly based on the original wordlist as semantically congruous but phonologically disparate words, or words deemed etymologically related, were gradually introduced by the speakers.

Acknowledging Huffman's (1976:541) cautionary insights regarding the inadequacy of large unfettered wordlists for solid comparative work, the data was collated and patterns of phonological shift were established before then commencing the elicitation process for a second time with the original wordlist being discarded in favour of the prompting of speakers to fill in gaps by identifying cognates according to the now established correspondences; this concomitantly allowed confirmation of any irregularly patterning forms as true exceptions rather than errors in transcription or on the part of the speaker. ${ }^{22}$ As a relatively homogeneous group, extensive semantic shifting in Northern Chin is not particularly common; difficulties in identifying cognates were more often based around relative usage with common words in one language being restricted to the older poetic or song-based layer in another. A particularly valuable outcome of this second stage of elicitation was the establishment of lexical variation in verbal inflections which the speakers were asked to provide via prompting through knowledge of syntactic structures based on previous observations in the literature. ${ }^{23}$

An awareness of the possible distorting effects of tone sandhi and speaker multilingualism had to be maintained throughout the elicitation process. Speakers

[^8]sometimes initially cited sandhi alternated inflections based on the conditioning environment in the sentences they concocted to generate the inflections. Nevertheless, when eliciting single morphemes, excluding cases of indivisible binomial forms, tone sandhi was generally not a problem. ${ }^{24}$ Speaker multilingualism occasionally caused disagreements amongst speakers with forms being cited; cases no doubt remain and may account for some discrepancies in data-set. It should also be noted that, particularly when citing verbal inflections, speakers were liable to make analogical errors much akin to an English speaker mistakenly saying catched for caught.

There was a time when it would have seemed that the necessity to carry out such fundamental research on the basic phonology of these fascinating languages would have been completed long before the present day. The once promising future inaugurated by The Chin Hills Linguistic Tour of 1954 by Eugénie Henderson, Theodore Stern and Gordon Luce did not seem to have fate on its side. The foreshortening of the trip and the loss of much of Henderson's data on the tour is recounted by Luce (1959a:20-3, 1968:106), and the projected combined work based on the tour, Studies in Chin Linguistics, never made it to publication: ${ }^{25}$ Henderson's reduced contribution appeared separately in 1965; Stern's was partially published in 1963 but the textual data on which it was based only appeared later in a different journal in 1984; Luce's mammoth contribution, Common form in Burma Chin Languages, based on further research from his base in Rangoon and including much data from Southern Chin languages, still remains largely unpublished. ${ }^{26}$ Other good contributions have been isolated and tend to have lacked any substantial comparative setting. ${ }^{27}$

[^9]
### 1.4 Northern Chin Rhymes

The five vowels of Northern Chin are generally regular across all six languages; they superficially appear to be divisible into two sets of distinctive length except in open syllables where the vowel naturally surfaces as long unless occurring as the short unstressed initial syllable of a disyllabic compound. ${ }^{28}$ Stern (1963:228-9) differs from all other analyses of Northern Chin languages to suggest in his analysis of Sizang that the length distinction may be better interpreted as syllabic peaking on the vocalic nucleus or on the sonorant coda. This is supported by some similar observations by Melnik (1997a:17) on Lai Chin, and helps to account for the longer realisations of sonorant codas after short vowels such that, particularly in rising contour tones, the distinction in syllable length is relatively small whether the vowel surfaces as long or short. Stern's distinction may be more conventionally noted in terms of syllable weight; with weight being unable to fall on an obstruent coda, in purely notational terms it makes more sense to mark the distinction on the vowel, although with sonorant finals it could equally well be marked on the coda instead. For the purposes of exposition, the vowels $e$ and $o$, for which a more conventional transcription would call for [ $\varepsilon:$ ] and [ $0:$ ] will be treated here in the same structural relationship to $\varepsilon$ and $\rho$ as $i$ and $u$ with $I$ and $v$. This approach essentially follows the structural arrangement of the American phonetic system, as originally outlined by Boas et. al. (1916:2-3;9), while incorporating Halle \& Mohanan's (1985:72-6) refinements regarding tense $e$ and lax $\varepsilon$ to then further extend it to $o$ and 0 . The intent here is not to assume any tense/lax distinction in Northern Chin vowels but rather to incorporate Pulleyblank's observation (2003:723) that an association of syllable weight with the traditional tense/lax distinction may sometimes be drawn. Lindau's observations (1978:557-9), noting tense vowels to be relatively more centralised in the vowel space, sits well with the phonetically reasonable transcription of the low vowel as an alternation of $\mathfrak{e}$ and $a$ to give the following vocalic distinctions in Northern Chin:

[^10]The two spectrograms below of the Sizang words $1 \mathrm{~lm}{ }^{11}$ image $n$ and $\lim ^{11}$ ball of string $n$ show the difference in surface realisation of syllable weight on the coda or on the vowel:

### 1.4.1 Diphthongs

The analysis here treats $-j$ and $-w$ as codas that may freely occur after all vowels excluding $I / i$ and $u / u$ respectively. Alternatively, Luce (1962a:55-60) treats all such cases as rising diphthongs ending in $-i$ or $-u$. The situation in Mizo, for which Henderson (1948:716) and Bright (1957b:101) use $-j$ and $-w$ while Burling (1957:154-5) and Weidert (1975:7) use $-i$ and $-u$, rests on little more than, as Bright (1957a:25) notes, a question of priorities regarding phonemic minimalism or syllabic regularity. Phonetically there is of course no real distinction and the discussion is rather inconsequential especially as linguists have naturally dwelled on the transcriptional distinction between the glides $-j$ and $-w$ and their vocalic counterparts $-i$ and $-u$ when the distinction is equally valid to all other sonorant codas which just happen to lack such transcriptional flexibility. However, in phonological terms, the divorcing of the synchronic from the diachronic entailed in the phonemic analysis, means the syllable will be favoured in this work.

With the exception of the secondary dissimilatory diphthongisations of Sizang $e$ to $\varepsilon a$ in all environments except before $-t,-n$ and in open syllables, and Sizang $o$ to $\rho a$ before $-j,{ }^{29}$ the establishment of glide codas restricts diphthongs to two contrastive

[^11]types distinguished by the presence or absence of rounding. Contrary to Stern's suggestion (1963:229) that Sizang diphthongs have contrastive weight, which most likely stems from a confusion with Tedim either on the part of himself or his informant, syllabic weight is manifested with the nucleus either at the end in Mizo, Zahau, Zo and Tedim or at the beginning in Thado and Sizang:

| Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $1 a$ | $I a$ | $e I$ | $1 e$ | $I a$ | $i e$ |
| $v a$ | $v a$ | $o v$ | $v o$ | $v a$ | $u e$ |

The following surface variations may be noted: Zo vo and Sizang ue surface as ve and $u \varepsilon$ respectively before $-j$; Mizo, Zahau and Sizang reduce the unrounded diphthong before $-n^{\text {III }}$ to $\varepsilon$ in derived forms while all six languages, excepting Tedim, reduce the rounded diphthong to $\rho$ in the same environment; ${ }^{30}$ all six languages reduce the rounded diphthong before $-m^{\text {III }}$ to $\rho$ in derived forms. It should also be remarked that the Thado diphthongs -ou and -er tend to approximate the pure vowels [ $\mathrm{o}:]$ and $[\mathrm{e}:]$ as noted by Luce (1962a:57-9). In open syllables, they are very similar to the closed rhymes $-\partial w[\partial 0]^{31}$ and $-\varepsilon j$ from which they are nonetheless consistently discernible in words like kov ${ }^{\text {III }}$ burrown and kow"I call vt or $\left.{ }^{\text {h }} \mathrm{le}\right|^{\text {III }}$ snap $v t$ and ${ }^{\text {h }} 1 \varepsilon j^{\text {III }}$ sift $v t:^{32}$

[^12]

Weidert's rather arbitrary rejection (1981:31-2) of Henderson's proposal (1948:721) to interpret the high vowel components in Mizo Ia and $v a$ as palatal and labial features of the syllable initial is questioned by Matisoff (1982:29) who suggests that in diachronic terms it is of little relevance whether one treats the feature as part of the initial or the nucleus. For most Tibeto-Burman languages Matisoff's comment would be valid, but treating the first part of the diphthong as part of the initial reopens the possibility in Northern Chin for contrastive syllable weight in individual languages, as Stern supposed for Sizang diphthongs, which does not occur. The two spectrograms of Tedim pran' and Sizang pien' come into being vi below exemplify the difference in syllable weight between the two languages:

### 1.4.2 Codas

Codas are always unreleased and are voiceless unless sonorant. A discussion of the correspondences of morphological inflections requires a diachronic analysis that will be addressed in Chapter 7. The correspondences of uninflected forms are noted below:

| Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $-k$ | $-k$ | $-?$ | $-p$ | $-k$ | $-k$ |
| $-r$ | $-r$ | $-?$ | $-1 /-a$ | $-k$ | $-k$ |
| $-?$ | -2 | --11 | $-1 I$ | $-?$ | -1 |
| $-j$ | $-j$ | $-j$ | $-j$ | $-j$ | $-j$ |
| $-w$ | $-w$ | $-w$ | $-w$ | $-w$ | $-w$ |
| $-t$ | $-t$ | $-t$ | $-t$ | $-t$ | $-t$ |
| $-l$ | $-l$ | $-l$ | $-l$ | $-l$ | $-l$ |
| $-p$ | $-p$ | $-p$ | $-p$ | $-p$ | $-p$ |
| $-\eta$ | $-\eta$ | $-\eta$ | $-\eta$ | $-\eta$ | $-\eta$ |
| $-n$ | $-n$ | $-n$ | $-n$ | $-n$ | $-n$ |
| $-m$ | $-m$ | $-m$ | $-m$ | $-m$ | $-m$ |

### 1.4.2.1 Zahau -ow? / -ew?

Zahau - $\omega w$ tends to be pronounced with a more open articulation than in the other five languages where it surfaces as [əu]. Consequently words like tow? seat vt are barely distinguishable from the inflected form tew? of taw ${ }^{\text {III }}$ sulk vi. Luce (1962a:60) notes this also to be the case in some Mizo dialects.

### 1.4.2.2 Glide Codas and Svllable Weight

Henderson (1948:716-7) makes no vocalic length distinctions before glides in Mizo, but Bright (1957a:25-6) notes a distinction before $-j$ of all possible vowels in Mizo
and tacitly assumes one before $-w$. Unless the surface vocalism is shortened for morphological reasons noted in 7.1, the Mizo data here only supports Bright's distinctions (1957a:25-6) of $-e j /-a j$ and $-o j /-o j$ such that his other distinctions may be rejected accordingly: the data in Weidert (1975:24) suggests Bright's $-e j$, contrasting with regular $-\varepsilon j$, to be restricted to certain phonological exceptions associated with adverbial and onomatopoeic words which may be safely excluded; ${ }^{33}$ Bright's case in point for $-u j$ is the word ${ }^{\text {l }}{ }^{\text {muj }}{ }^{\text {III }}$ muzzle $n$ which is the only instance in the data-set without $-v j$ and for which a proposal for an external source is made in 6.5.4; ${ }^{34}$ there are no cases of variation before $-w$, for which $-i w,-e w,-\partial w[\partial 0],{ }^{35}-a w$ are attested, except for ${ }^{\text {k }} 1 \varepsilon w^{1}$ leech $n$ for which an external origin is suggested by the irregular initial correspondences with the other Northern Chin languages.

The Mizo distinctions of $-e j / /-a j$ and $-o j /-o j$ may be extended to the other five Northern Chin languages, although Thado form 2 derivations with $-a j^{\text {III }},-o j^{\text {III }}$ and $-u j^{\text {III }}$ tend to surface as $-e j^{i I I},--j j^{\text {III }}$ and $-0 j^{\text {III }}$ such that gaj pregnant vi may occur in form 2 regularly as gaj ${ }^{\text {III }}$ or in a reduced form $\mathrm{gej}^{\text {III }}$ while gaj ${ }^{\text {III }}$ impregnate $v t$ and its regular form 2 gej ${ }^{\text {III }}$ are invariable. The other languages also concur with Mizo in not supporting any real distinction between $-\varepsilon j,{ }^{36}-i w,-e w,-\partial w[\partial u],-a w$. The only exceptional forms are the following: Thado has -Iw instead of -iw in elbow $n$, which is the only word attesting this rhyme, such that whether this is a regular Thado reflex or the result of the word being a contraction of an original compound noun, as Luce (1962a:60) tentatively suggests, remains unclear; $-\varepsilon w$ is attested in one case in Thado, Zo and Sizang under deplete vi. However, a clear distinction between $-v j$ and $-u j$ may be found in both Thado and Tedim as supported by Luce's transcriptions (1985.II:70-87) of -wi and -ui respectively. Sizang concurs with Mizo solely reflecting - $j$, and this may be extended to Zahau although -vj shifts to $-i$ after coronal initials; Zo conversely merges them as $u j .{ }^{37}$ Occasional differences between Tedim and Thado seem to be due to external

[^13]influences: Tedim tuj" water $n$ and tuj ${ }^{1}$ egg $n$ correspond to Thado toj" water $n$ and toj ${ }^{1}$ egg $n$, but table A in Luce (1962a) has Thado tuj' egg $n$ and Luce (1985:II.72;82) has Xôngsai tuj" water $n$ and tuj ${ }^{11}$ egg $n$ which suggest the variation may be due to the influence of a similar alternative word for water $n$ in Thado discussed under Water (\#56); Thado nuj" run-down vi, corresponding to Tedim noj", may have been influenced by a semantically identical variant gooj". On the basis of the above, the following distinctions may be made:

| Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $-v j$ | $-v j /-i$ | $-v j$ | $-u j$ | $-v j$ | $-v j$ |
| $-v j$ | $-v j /-i$ | $-u j$ | $-u j$ | $-u j$ | $-v j$ |

### 1.4.2.3 Thado - ? and Svllable Weight

There is a reduction of the surface length of vowels bearing syllabic weight in Thado syllables before a glottal stop. In words in tones I and II this is not to the extent of a vowel not bearing syllable weight and the distinction is not noted in the transcription here; ${ }^{38}$ in words in tone III the vocalism merges with that of a vowel without syllable weight and is noted as such in the transcription. Consequently the inflected form of Thado pe?" back-kick vi is $\mathrm{p} \varepsilon$ ?, which can no longer bear distinctive tone, ${ }^{39}$ rather than $\mathrm{pe} ?^{\text {III }}$ as would be expected by analogy with Zo which, excluding tonal distinctions, is homophonous in the uninflected form. The two Thado forms are shown below: ${ }^{40}$

[^14]
### 1.4.2.4 Zo -?/-a

When corresponding to Mizo or Zahau $-r$, the Zo glottal coda is only retained after the mid-vowels $\varepsilon / e$ and $\rho / o$; after $1 / i, \cup / u$ and $\mathcal{e} / a$ it has vocalised to $a .^{41}$ The resulting reflexes of ia and $v a$ remain distinct from the original Zo diphthongs ie and vo discussed in 1.4.1. The glottal coda in Zo is much weaker than in Thado; the distinction between Zo -1 and Tedim -k in the spectrograms below for Zo pe? back$k i c k v i$ and Tedim pek ${ }^{1}$ wag tail vi is discernible but is not nearly as pronounced as in the Thado example discussed in 1.4.2.3. ${ }^{42}$

### 1.5 Initials

Northern Chin has a three-way distinction of voiceless, voiceless aspirated and voiced obstruents. Sonorants may additionally be pre-aspirated in Mizo and Zahau although, as noted by Luce (1962a:43-4), there are occasional discrepancies where one or the other patterns like Thado, Zo, Tedim or Sizang in not distinguishing the aspiration. It is probably not coincidental that many of the words noted by Löffler (2002a:133-4) as discrepant in the Southern Chin language Maraa correspond to the ones listed here and it is likely that many such cases may be attributable to external influences.

[^15]| Mizo | Zahau | Thado | Zo | Tedim | Sizang |

### 1.5.1 Alveolars versus Dentals

The coronals $t$-, $t^{h}$-, $d$-, ${ }^{(h)} n$-, ${ }^{(h)} l$ - have a dental articulation in Mizo and Zahau. Luce (1962a:40) extends this to the other four languages which is supported by Stern (1963:226) for Sizang. However, the evidence here supports Henderson (1965:9$10 ; 16$ ) in noting purely alveolar articulations in Tedim, and contrasts Stern in only noting a dental articulation in Sizang for unaspirated $t$-; Zo appears to parallel Sizang while Thado inconsistently attests a dental articulation for $t^{h}$ - as well. The dental articulation in Mizo and Zahau, ${ }^{43}$ most likely represents the original state of affairs with the shift to an alveolar articulation possibly influenced by Burmese; in this regard it would be interesting to compare the reflexes on the Indian side. There is an

[^16]allophone $t$ - of Zo, Tedim and Sizang $t$ - before $I / i$ which is reflected as $s$ - when from underlying $t^{h}$ - except in Sizang where it becomes $t^{h}$ -

### 1.5.2 Luce's ${ }^{\prime} \mathrm{g}$ -

Luce (1962a:52, 1962b, 1985:II.70-87) transcribes Zo, Thado and Tedim $g$ - as ${ }^{\eta} g$-. This pre-nasalisation is not noted by Henderson (1965:16) for Tedim and, although there is possibly some faint nasalisation of $g$-, the spectrograms below of Tedim gem' forest, territory $n$ and $\mathrm{gem}^{1}$ dare $v t$ do not conclusively warrant a transcription of ${ }^{\eta} g$ for the former. Nevertheless, Luce's observation provides a nice bridge between $g$ and the nasal $\eta$ - in Sizang, and the role of nasalisation as an articulatory mechanism for maintaining voicing will be discussed further in 3.5.2.3.

### 1.5.3 Zo ${ }^{h} l$ - and $h$ -

The variation between ${ }^{h} l$ - and $h$ - in Zo, when not correlating with $h$ - in any of the other languages, generally reflects speaker idiosyncrasy. One informant made a lexical distinction between the two such that moon $n$ was always ${ }^{\mathrm{h}}$ la ${ }^{111}$ and wing, feather $n$ was always ha'II. The relevance of this to theories of lexical diffusion, as proposed by Wang (1969:12-8) are discussed in 8.1.1. In the word list only the transcription ${ }^{h} l$ - is used.

### 1.5.4 Voiced Fricatives

Thado post-alveolar 3-appears to be slipping towards the alveolar $z$ - attested in the other languages. This variation is also noted by Luce (1962c); in the word list only the
transcription 3- is used. ${ }^{44}$ The labiodental fricative $v$ - occurs as $h$ - before $v / u$ in Sizang. Both these changes hint at the previous source of the voiced fricatives in the glides $*_{j}$ and * $w$ - which tempers the proposals for phonemic minimalism, discussed in 1.4.1, in treating the codas $-j$ and $-w$ as $-i$ and $-u$. ${ }^{45}$

### 1.5.5 Zahau ?-

The glottal stop is essentially a default feature of vocalic onset but the marked contrast of overtly creaky phonation in Zahau in comparison to the other languages suggests Osburne's (1975:3) tentative supposition of a distinct phoneme in Zahau to be preferable. Henderson $(1965: 13 ; 16)$ and Stern $(1963: 226)$ both note a prominent glottalic onset in the word for $\operatorname{dog} n$ in Tedim and Sizang respectively; Weidert (1981:9) questions Henderson's transcription and the data-set here provides no evidence for such an onset in either language. The glottalic onset in the spectrogram for Zahau ใoj $^{11} \operatorname{dog} n$ is clearly evident when compared to Tedim $0 j$ j" $\operatorname{dog} n$ :

### 1.6 Tones

In syllables with syllable weight falling on the vowel or the sonorant coda, Mizo and Zahau have four possible tones while Thado, Zo, Tedim and Sizang have three.

[^17]|  | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| I | 1 | $\lambda$ | $\lambda$ | 1 | 1 | $V$ |
| IIa | $(\lambda$ | $1)$ | $y$ | $\lambda$ | $\lambda$ | $\lambda$ |
| IIb | $(y$ | $y)$ |  |  |  |  |
| III | $V$ | $V$ | $V$ | $y$ | $V$ | $y$ |

### 1.6.1 Tone I

This is attested in Mizo, Zo and Tedim as a level tone. Stern's observation (1963:22930) that in Sizang it often surfaces as a low level tone $ل$ is also supported here, but his treatment of the frequent Sizang high level tone 1 as part of the basic tone system is correctly identified by Luce (1962a:68) as a result of sandhi. The Thado and Zahau rising contours correlate with tone $\mathrm{II}(a)$ elsewhere, but Hyman (2005) and Osburne (1979:183) note them respectively to have high level sandhi alternates. Although Osburne also notes an alternation in Zahau with the low falling tone in a separate environment, it is tempting to invoke Yue-Hashimoto's suggestion (1986:171-3) that sandhi alternations of tones that have undergone flip-flop, in this case between tones I and II, may reflect earlier forms. Treating tone I as an original level tone would support its treatment in the introduction to Chapter 6 as the unmarked form, but further research into Northern Chin tone sandhi is required.

Stopped syllables with syllable weight not falling directly on the vowel are generally not tone bearing units; their pitch tends to approximate that of tone III. Consequently the occlusion of Mizo and Zahau $-r$ to $-?$ or $-k$ in Thado, Zo, Tedim and Sizang usually involves concomitant re-assignation of syllable weight to the vowel if not already there. However, in Tedim and Sizang there are a few exceptions in tone I in which the syllable weight has not shifted solely to the vowel but the syllable has curiously retained the distinctive tone contour. The case of Tedim $\mathrm{t}^{\mathrm{h}} \mathrm{ek}^{\mathrm{j}}$ new $v i$, corresponding to Mizo $t^{\text {h }}{ }^{1} r^{1}$ new $v i$, is also noted by Henderson (1965:20), ${ }^{46}$ and may be contrasted with Tedim $t^{\mathrm{h}} \mathrm{ek}$ itch $v i$ which, along with Mizo $\mathrm{t}^{\mathrm{h}} \mathrm{ek}$ itch $v i$, is unable to bear distinctive tone. In the spectrograms below the Tedim word for new $v i$ has a higher pitch contour than the default contour in the following word itch vi:

[^18]

The same word, usually after the animal prefix $s e$-, also means serow $n$ in Tedim and Sizang; the irregular correspondence between the Mizo and Zahau forms, $\mathrm{t}^{\mathrm{h}} \mathrm{ar}^{1}$ and $t^{h}{ }^{\prime \prime} r^{\prime \prime}$ respectively, suggests an external origin. Another case in the data set involves Tedim hek difficult vi which is confined to a binomial form that allows Henderson (1965:94) to suggest that its curious behaviour may be attributable to its adverbial status. ${ }^{47}$ The sole other case in the data-set is Tedim kok ${ }^{1}$ peel up vi, whose tonal contour is supported by Bhaskararao (1996:54), which has a transitive derivative xok that curiously does not bear distinctive tone. The cases above are all equally applicable to Sizang, and although a specific account cannot be made for the curious tonal contour of new $v i$, the evidence above suggests its exceptional status may stem from a previous adverbial or external source. ${ }^{48}$

### 1.6.2 Tone II

The treatment of tones IIa and IIb in Mizo and Zahau as a secondary split from an original single category follows the proposals by Luce (1959a:28-9, 1985:I.83), whose tone categories II and III are inverted in the terminology used here, and is discussed in 6.1. Osburne $(1975,1979: 183)$ does not distinguish tones IIa and IIb in Zahau, but the distinction is noted in table I of Luce (1959a), table A of Luce (1962a), Luce (1962d) and Yip (2004:972). The rising contour for this category in Mizo, Zo, Tedim and Sizang is supported by a possible flip-flop of tones I and II in Zahau and

[^19]Thado discussed in 1.6.1. It is probably not coincidental that a flip-flop of Zahau tones I and IIa would bring its tone system into complete alignment with Mizo.

### 1.6.3 Tone III

This is attested as a falling tone in all the languages which concurs nicely with its historical source proposed in the introduction to Chapter 6. Luce (1962d) and table I of Luce (1959a) only note Thado tones I and II but elsewhere Luce (1962a:68, 1962c) notes the tone III contour which he suggests may be associated with phrase intonation; it is unequivocally attested in the word list here. The contour of Zo tone III is supported by Luce (1962a:68, 1962d), but it sometimes appears to approximate that of Tedim tone III which conversely has a sandhi variant, noted by Luce (1962a:11), that parallels the Zo contour.

## Chapter 2: Old Burmese

The validity of orthographic evidence alongside modern dialect evidence has been the subject of some rather inconsequential debates concerning the reconstruction of LoloBurmese and hence Old Burmese. As noted by Beckwith (2002b:213-4), the main difficulty stems from an over-reliance on modern Written Burmese forms in the literature. While Matisoff (1969:119-20) chides Burling (1967:3) for rejecting Written Burmese as a valid source of evidence for his reconstruction of the Lolo-Burmese subgroup, Jones (1970:231) believes Matisoff goes too far in the other direction. Unfortunately, the lack of any real concordance of Inscriptional Burmese forms means that inscriptional evidence, gleaned haphazardly from sporadic citations in other academic works, tends to be unjustly conflated with Written Burmese in terms of usefulness. Benedict's dismissal (1972a:41) of the pivotal role of Inscriptional Burmese in distinguishing Tibeto-Burman medials is approvingly cited by Matisoff ( $1978 \mathrm{~b}: 30,2003: 70$ ) which will no doubt allay some of Jones' concerns but not those of Beckwith. The unwieldiness of Inscriptional Burmese in terms of its inconsistent spellings is noted by Pe Maung Tin (1929:78) but he hastens to observe its paramount importance in elucidating the evolution of the language. Notably, Ba Shin's study (1962:36-9) of the regularities behind the alternations shows them to represent little more than orthographic variation before script standardisation, from which the fundamental underlying system, as will be presented below, is not difficult to deduce.

### 2.1 Vocalism

### 2.1.1 Three Vowel i/u/a system

Jones (1976:45) reduces the vocalism to a three vowel system accordingly: ${ }^{49}$

| SB |  | OB | SB |  | OB | SB |  | OB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| -i | $\bigcirc$ | -i | -u | I | -u | -a | $\rightarrow$ | $-a$ |
| -eI | 6-1 |  | -wer | G-1/ ${ }_{\text {- }}$ | -uj | -e | - | $-a j$ |
| -eĨ | $\bigcirc$ | -im | -oũ | $\mathrm{T}^{-1}\left(\frac{\square}{1}\right)$ | -um | -ã | $-\delta(-)$ | -am |
|  | -¢ | -in |  | -§ | -un | -a | -¢ | -an |
|  | $\frac{0}{1} \mathcal{E}$ | -in |  | 6-x | -ul | - | - $\delta$ | -an |
|  | - | $-i p$ | -ov? |  | -up | $-a ?$ | - $\delta$ | -ap |
| $-e n ?$ | $\bigcirc$ | -it | -ov? | - $\bigcirc$ | -ut | $-a$ ? | -o์ | -at |

[^20]| $-a 12$ ㅇํ | $-i k$ | -ave 6-om์ | -uk | $-\varepsilon$ ? | -र์ | -ak |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | -ov $\frac{\circ}{1} 10 \%$ | -uw | -o | ¢-ऽ/-ס́ | -aw |
|  |  |  |  | -1? | -¢ | $-a c$ |
|  |  |  |  | -i/ei/e | -2ई | $-a n$ |

Following a line of thought similar to Duroiselle (1915:99-102), Jones (1988:207) removes the rhyme $-\int \preceq-a n$ due to its various non-nasal $-i,-e r$, $-e$ pronunciations ${ }^{50}$ in Modern Burmese. ${ }^{51}$ Contrary to Duroiselle, and in line with the criticisms made by Blagden (1916a:94-5), he supposes that it once existed but was lost very early on, ${ }^{52}$ yet his treatment of the two palatal codas as -£ -ac and -§ -an disregards Shafer's proposal (1941:22) to treat them as reflecting Old Burmese $-i k$ and $-i \eta$ in which the palatal feature of the vowel is assumed to have shifted to the coda. If Shafer's proposal is correct, an account then has to be made for what $\frac{0}{1} \kappa^{\circ}$ and $\frac{\circ}{1} \mathcal{E}$ (Jones' -ik and -iy) represent. A year previous to Shafer's article, Luce (1940:304) had suggested that most words with such rhymes seem to be $8^{\text {th }}$ and $9^{\text {th }}$ century Shan loanwords. This proposal is restated in Luce (1985:I.100) and the tacit assumption that the remainder are from Mon, Shan and Pali/Sanskrit is made in Luce (1977b, 1977c). Shorto, in Pulleyblank (1963:217), also supports Luce's proposal for an external source. Unaware of, or unwilling to accept, Luce's proposal, Benedict (1972a:76) ${ }^{53}$ proposes that the source of these rhymes was Tibeto-Burman long *-u:k and *-u:y in
 scheme. Nishi (1997:983-4) marvels at Benedict's ability to find such cognates in Tibeto-Burman when none are to be found in much more closely related Burmish languages. This conundrum is solved by Dempsey (2001:207-8) who shows that Benedict's correspondence sets are based on faulty associations. Of relevance to the

[^21] with Mizo puk ${ }^{\text {Ilb }}$ concave $v i,{ }^{55}$ kuy $^{\text {Ila }}$ tree－trunk $n$ and，muk ${ }^{\text {IIb }}$ dull（colour）$v i$ ；Shorto （2006：148－9）shows the first Burmese form to be Mon－Khmer in origin and Luce （1977b）shows the following three to be Shan．The external origin of sai？$\AA^{\circ}$ ผ cik plant vt，which Benedict compares with Mizo fok erect vi，has not been identified but the correct source of the Mizo form is identified under Erect（\＃17）．Shafer＇s proposal， with the additional observations by Luce and Shorto，allows Gong（1980：458－61）to modify Jones＇scheme by omitting $\frac{\circ}{\varrho} \mathcal{\kappa}$ and $\frac{\circ}{\varrho} \mathcal{C}$ from consideration accordingly：

| $\bigcirc$ | －i | I | $-u$ | $\rightarrow$ | $-a$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\bigcirc$ | －ij | －us | －uj | －ぶ | －aj |
| $\bigcirc$ | －im | $\square^{-1}\left(\frac{0}{1}\right)$ |  | －¢ | －am |
| $\bigcirc$ | －in | －¢ | －un | －§ | －an |
| －ひీ | －ip | $6-\mathcal{C}^{1}$ | －un | －$\delta$ | －an |
| $\bigcirc$ | －ip | ${ }_{-}{ }^{\text {S }}$ | －up | －$\delta$ | －ap |
| $\bigcirc$ | －it | －o | －ut | －¢ | －at |
| －¢ | －ik | 6－＞¢ | $-u k$ | －¢ | －ak |
|  |  | $\bigcirc$ | －uw | －$\delta$ | －aw |

## 2．1．2 Two vowel i／a system

A distributional issue，not raised by Jones or Gong，occurs with medial－w．The fact that it may freely occur after any consonant leads Matisoff（1976b：v，1986：83）to treat it as part of the rhyme rather than as part of an initial consonant cluster．In terms of the phonological system of Inscriptional／Written Burmese this is entirely justified and compares with the kaikou／hekou（rounded／unrounded）distinction in Middle Chinese at around the same time．A concomitant difficulty with this otherwise sound proposal is that medial－$w$－is restricted in distribution to before the low vowel $a$ ．Noting this complementary distribution of $-u$ with $-w a,{ }^{56}$ Pulleyblank（1963：214－8）reanalyzes $-u$ as－wi thereby reducing the system to a two vowel $i / a$ contrast：${ }^{57}$

[^22]| $\bigcirc$ | -i | I | -wi | $\sim$ | $-a$ | $\square$ | -wa |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\bigcirc$ | -ij | -๗ | -wij | -w | -aj | ${ }_{-0}$ | -waj |
| - 6 | -im | ${ }_{-} ¢(\stackrel{\square}{1})$ | -wim | $-¢(-)$ | -am | ${ }_{-}$¢ ( $\left(\frac{\square}{0}\right)$ | -wam |
| - § | -in | -¢ | -win | -§ | -an | -§ | -wan |
| -2์ | -il | 6-oc | -wil | -c | -ay | ${ }_{-}{ }^{\text {c }}$ | -way |
| $\bigcirc$ | -ip | ${ }_{-}{ }^{\text {¢ }}$ | -wip | - $\delta$ | -ap | $\square_{-} \delta$ | -wap |
| $\bigcirc$ | -it | $\bigcirc$ | -wit | -¢ | -at | ${ }_{\circ}$ - | -wat |
| -¢ | $-i k$ | -つณీ | -wik | - ¢ | -ak | -¢ | -wak |
| $\bigcirc$ | -iw |  |  | - $\delta$ | -aw |  |  |

### 2.1.3 Two Vowel I/a System

### 2.1.3.1-ik/-in versus -ac/-an

In the above discussion, it has been assumed that Shafer's derivation of -£ -ac from ik is phonologically reasonable. Lehman (1970:5) and Matisoff (1973a:79) both note that the modern standard Burmese pronunciation of $-i$ ? [ i ] implies an extraordinary circular sound change in which the palatal feature that originally shifted from the vowel to the consonantal coda has subsequently shifted back to the vowel again. A more significant difficulty is that while palatal medials were able to palatalise Inscriptional Burmese dental codas, as will be discussed below, the high front vowel in Shafer's rhymes -it and -in was not able to do so. Bradley (1985:194) claims that -$\mathscr{\Phi}-a c$ has been pronounced $-i$ ? since at least 1450 but this results from a misreading of Miller $(1954: 383)^{58}$ and, as Dempsey (2001:219) observes, a prejudice towards later developments. Dempsey (2001:218) uses Hla Pe's data (1960:74;94) on Pali loanwords to show that Shafer's $-i k$ must have been much closer in pronunciation to -$\AA-a c$ as its conventional transcription would indicate. ${ }^{59}$ In his original analysis, Jones (1976:45) observes that the digraph $\frac{\circ}{1}$ is restricted to the velar codas $-\delta-w,-\mathcal{N}^{\delta}-k,-\mathcal{C}$ $-\eta$ in a similar manner to the digraph $6-\mathrm{O}$. He logically concludes that the phonetic change undergone before velars by the sound represented by $\circ$ caused the scribes to

[^23]create a new symbol $\frac{\circ}{\mathrm{l}}$ to represent it. In purely synchronic terms this is reasonable and, in light of the phonological difficulties with Shafer's hypothesis, Nishi's (1999:676) berating of Jones for not acknowledging Shafer's contribution may not be entirely warranted. The complementary distribution of $-\frac{\circ}{}$ and $\frac{\circ}{L}$ makes it curious how much the phonological value of the latter has been debated in the literature; ${ }^{60}$ this is particularly the case when, as noted by Ba Shin (1962:28) and Sawada (2003:346), there are even instances in the inscriptions when the digraph $\frac{\circ}{\mathrm{L}}$ is found simply as $\circ$ before velars. Consequently, following Luce's and Shorto's observations that $\frac{\circ}{\mathrm{L}} \mathfrak{\infty}$ and $\frac{\circ}{\mathrm{L}} \mathcal{E}$ represent loanwords an account must be made for how the palatal finals $-\AA$ and $\sum \mathfrak{\int}$ came to replace what in synchronic terms should be their slots in the system.

### 2.1.3.2 Reanalysis of ias it

Pulleyblank (1963:218) reinterprets $i$ as $i$ to create a vertical vowel system corresponding to his analysis of Old Chinese as having a vertical $\partial / a$ vowel system. ${ }^{61}$ Pulleyblank's proposal also helps to account for contrasts like $-\frac{\circ}{}$ and ${ }^{\circ} \mathcal{G} \mathfrak{S}$ which in Jones' and Gong's systems represent $-i$ and $-i j$. In phonological terms reconstructing two separate rhymes of this nature does not pose any difficulties; in phonetic terms, unless one is perhaps assuming a vowel length distinction, they are indistinguishable. Ironically this appears not just to be a stumbling block for phonologists trying to tether their theories down to a phonetic reality, but a difficulty for some of the early Burmese scribes whose constant confusion of these two rhymes renders Luce (1981:iii) unable to disambiguate them. It is tempting to assume that they are simply scribal variations devoid of phonological significance much like the free alternation of $-a m$ as $-\oint$ or - . However their systematic distinction in Written Burmese and phonetic distinctiveness in modern spoken Burmese means this must not be the case. Reinterpreting them as $-i$ and $-i j$ allows for a very close but distinct interpretation of the two that under the lax spelling laws of the inscriptions would have easily been confused. Ideally the Chinese $\partial / a$ alternation would correlate perfectly with Burmese $\mathrm{i} / a$ as Pulleyblank's layout would imply. In fact the standard lowering of Sino-Tibetan

[^24]$\partial$ to Burmese $a$ in all syllables unaffected by preceding labializing or palatalizing features, ${ }^{62}$ or the codas $-j,-w$ and $-l$, means Sino-Tibetan rhymes such as $-\partial k$ and $-a k$ have merged in Burmese as the latter.

### 2.1.3.3 Palatal Rhymes -wac and -wan:

Pulleyblank (1977-8:191-2), who incidentally makes no note of what would otherwise be an inherent contradiction of his previous article, rejects his former treatment of $-\AA$ and $-\mathfrak{ల}$ as $-i k$ and $-i y$ to propose that they actually represent original palatals which support his reconstruction of palatal codas in Old Chinese. Pulleyblank does not discuss how this interpretation affects the symmetry of the Old Burmese vowel system but support for his proposal comes from the fact that there is evidence for the labialised rhymes ${ }_{-}^{-\Phi}$-wac and $-{ }_{\circ}{ }^{〔}$-wan in the inscriptions. They are so sparsely attested that it is tempting to treat them as scribal errors but, unlike the cases discussed in Ba Shin (1962:36-9), the phonological motivation for such variation is unclear. Luce ( $1981: 50 ; 60$ ) notes that the seldomly occurring -wac appears to be a variant of ${ }_{\mathrm{\imath}} \propto$-wit which it settles as in Written Burmese. Only one nasal form, tywer ${ }^{\text {II }}$
 its spelling is noted in Stewart \& Dunn (1940-81:38), Luce (1981:65) and Nishi (1974:26). ${ }^{63}$ Nishi (1999:668) notes the loss of the coda in Written Burmese to be curious, but in terms of its modern pronunciation in -wer it is entirely concordant with other words with an original - $\sum^{\mathcal{S}}$-an rhyme. ${ }^{64}$ It seems likely that the inherent incompatibility of labial and palatal features in the same syllable led -wan to become wer much earlier than -an became -er; the development of -wac into -wit concurs with the later development of -ac into -it (and modern - 1 ), after the original rhyme in ${ }^{\circ}$ © $i t$ had shifted to a more diphthongal articulation that would eventually give modern er?. In light of the above it seems that Old Burmese $\bar{\circ}^{\mathscr{®}}$-wac and $-\mathfrak{\sum}$-wan had almost entirely lost their palatal articulations prior to Inscriptional Burmese and that their occasional attestations are relics of their former selves.

[^25]
### 2.1.4 The Rhymes of Old Burmese ${ }^{65}$

|  | OB | ST |  | OB | ST |
| :---: | :---: | :---: | :---: | :---: | :---: |
| T -w | -wi < | $?^{66}$ | $\bigcirc$ | -wa < | *-wa |
| ¢ ¢ -w | -wij < | *-waj /-wal | $\square_{0}$ | -waj < | *-waj/-wal |
| $\mathrm{T}^{\text {¢ }}\left(\frac{\square}{\mathrm{L}}\right)-w$ | -wit $m<$ | *-wam | ${ }_{0}^{-1}\left(\frac{\circ}{0}\right.$ | -wam< | *-wam |
| -¢ | -win $<$ | *-wan | -§ | -wan $<$ | *-wan |
| 6-x ${ }^{-1}$ | -wit $<$ | *-(j) ay ${ }^{\text {w }} /-(j) \partial \eta^{w} /-w a \eta$ | ${ }_{0}{ }^{\text {c }}$ | -way $<$ | *-way |
| - | $<$ | - | ${ }^{-1}$ | -wan $<$ | *-way ${ }^{j} /-$ wal $^{j}$ |
| - $\delta$ - -w | -wip $<$ | *-wap | ${ }_{-}{ }^{-1}$ | -wap $<$ | *-wap |
| -¢ -w | -wit < | *-wat | - - ¢ | -wat $<$ | *-wat |
| - $\rightarrow$ ¢ - | -wik < | *-(j)ak ${ }^{w} /-(j) \partial k^{w} /-w a k$ | ${ }_{0}{ }^{-1}$ | -wak $<$ | *-wak |
| - | $<$ | - | ${ }_{-1}{ }^{\text {® }}$ | -wac $<$ | *-wak $/-$ wak $^{j}$ |

The Sino-Tibetan sources are based on comparative evidence to be discussed throughout this work. The merger of $-j \partial k$ and $-j \partial y$ with $-\partial k^{j}$ and $-\partial \eta^{j}$ in Old Burmese as -® $-a c$ and and $\frac{\circ}{L} \mathcal{E}-i y$ whose phonological values correlate with what would otherwise have been predicted for $-j \partial k$ and $-j \partial \eta$ by analogy with the developments of $-j \partial t$ and $-j \partial p$ to $-i p$ and

[^26]-it. The expected development of $-j \partial k$ and $-j \partial y$ to $-i k$ and $-i \eta$ has been overridden by the ability of velars to maintain a palatal articulation but the affinity between the two nicely accounts for Bradley's observation $(1985: 192 ; 194)$ that in the Arakanese and

### 2.2 Pure Initials

Hla Pe's observation (1948:62, 1960:97) that native Burmese words are not spelled with voiced initials is well-founded. Consequently Old Burmese, as it is generally attested in the inscriptions, appears to distinguish initials purely on the basis of aspiration. The lists of words in Okell (1969:205-8) and Thurgood (1981:35-7) show that, in the case of verbs, this often marks a distinction of transitivity with the aspiration, following the Northern Chin evidence in 7.4, being derived from a prefixal $s$-. The emergence of voicing sandhi in Burmese is discussed by Nishi (1998:255-9) who notes that in several cases voicing appears to have been retained after the loss of preceding syllables. ${ }^{68}$

A few late changes in the pronunciation of initials are dated by Pe Maung Tin (1922:129-30) to have begun around the end of the $18^{\text {th }}$ century: the shift of the palatals $\oplus c$ - and $\infty c^{h}$ - to the sibilant articulations $s$ - and $s^{h}-;{ }^{69}$ the shift of the original sibilant $00 s$-, concomitant with the former shift of the palatals, to a dental fricative $\theta$ $;^{70}$ the merger of $ๆ r$ - with $\omega 0{ }_{j-} .^{11}$ Excluding the merger of ${ }^{h} j$ - and ${ }^{h} r$ - as $\mathcal{f}$-, which caused some orthographic confusion and will be discussed further below, none of the above had any effect on the orthography, and the Old Burmese initials may be treated as follows:

[^27]| SB |  | OB | SB |  | OB | SB |  | OB | SB |  | OB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 2．3 Medials

The generally accepted treatment of medial ${ }_{-}-w$－as part of the rhyme in Inscriptional Burmese rather than as a medial like $-j-j, E-r$ and $--l$ ．which have a far more restricted distribution，was noted above．A difficulty in distinguishing－w－in this manner was hinted at by the requirement to set up a Sino－Tibetan $-j$－after all consonant types to account for later developments in Burmese vocalism．A closer study of Burmese orthography suggests that $-j$－may actually be reconstructed for Old Burmese with the same distribution as medial－w－such that it too may be separated from $-r$－and $-l$ ．

## 2．3．1 Medials－j－and $-w-$

Disregarding aspiration，the following table shows all possible initial types with $a$ vocalism．${ }^{72}$ The evidence for reconstructing Old Burmese medial $-j$－in cases where it is not attested consistently in Written Burmese or Inscriptional Burmese will be discussed on a case－by－case basis below．

| SB | OB |  | ST | SB |  | OB |  | ST |

As with Old Chinese, the medials may co-occur in the same syllable as $-j w-{ }^{73}$ The fact that $-j$ - takes precedence suggests that lack of evidence for medial $-j$ - after initial $w$ - may perhaps stems from phonotactic constraints concerning syllable structure.

### 2.3.1.1 Inscriptional Burmese $n$ - and Written Burmese Ør-

Taking the orthographic evidence at face value creates a curious distributional difficulty, noted by Okell (1971:23), whereby $-j-,-r$-, and $-l$ - may occur after $k$-, $p$ and $m$ - while only $-r$ - may occur after $\eta$ - as © - . This leads Bradley (1979:147), in spite of the lack of supporting evidence in Loloish languages, to propose $\eta r$-clusters in Lolo-Burmese; Matisoff (2003:81) similarly follows Benedict (1972a:44) in reconstructing Tibeto-Burman $\eta r$ - on the basis of the Burmese evidence. Yanson (1990:57-9, 2006:104-5) dismisses Bradley's suggestion, which may also be extended to Benedict and Matisoff, by noting that the only word with $\eta r$ - in the Inscriptions is
 original $\eta j$ - became spelled as $\eta r$ - in Written Burmese after the merger of the medials $-j$ - and $-r$. Yanson's proposal convincingly suggests that the transcription $\eta r$ - is used more as an orthographic convention based on the existence of such a combination in the script, to which it should be added that in most cases the Written Burmese spelling has settled in favour of $\boldsymbol{n}$-. A clear example of this is nov $\underline{\bigcup}^{1}\left\lfloor\mathfrak{n j i z w}{ }^{1}\right.$ dark (in colour) $v i$ which has an orthographic variant with medial $-r$ - $\mathbb{C}_{[ }$that Matisoff (2003:184) notes but does not attempt to explain. The proposal that $n$ - may represent an original $\eta j$ - is supported by Nishi's observation (1974:18-19, 1999:675) that $n$ - was not distinguished from $\eta j$ - before a high front vowel in much the same way that 0 mj - $k j$-, as noted by Nishi (1977:47-8), never occurs before a high front vowel in Inscriptional Burmese but in Written Burmese is always attested with the medial. Both Nishi

[^29](1974:20) and Yanson (2002c) use this to suggest that before a high front vowel, velars never had a palatal medial in Old Burmese; this is supported by the discussion of rhymes above in which the medial $-j$ - of $j a$ combines with the following $a$ to give $i$ and ultimately $i$.

### 2.3.1.2 Inscriptional Burmese rj-and Written Burmese $r$ -

Medial $-j$ - is also attested after the liquids $l$ - and $r$-; the former is maintained in Written Burmese whereas the latter, as noted by Benedict (1972a:54), has simplified to ๆ $r$-. Yanson (2002b:166) criticises Benedict's observation by citing jai cus / ๑ุp rja ${ }^{1}$ $d r y$ field $n ;{ }^{75}$ Nishi (1975:3, 1977:46-7) notes this to be the sole exception and that its spelling with $j$ - only began sometime between the $18^{\text {th }}$ and $19^{\text {th }}$ centuries, right around the time when the initial $r$ - was merging with $j$-, under an incentive to differentiate it from $\mathrm{ja}^{\mathrm{I}} 甲$ / จр $\mathrm{rja}^{\mathrm{I}}$ hundred $n$.

### 2.3.1.3 Old Burmese cj- and Inscriptional/Written Burmese c-

Another key source of identifying an original medial $-j$ - may be found in Nishi's observation (1974:1, 1999:668-9) that, along with initial $j$-, it caused secondary palatalisation of the dental codas $-t$ and $-n .{ }^{76}$ In the case of nasal codas, Nishi (1974:26) notes that these secondary palatalised ones may be distinguished from the original palatal nasals by their modern standard Burmese pronunciation $-\tilde{\imath}$ as opposed to $i / e \mathrm{I} / e .{ }^{77}$ The Written Burmese orthographic distinction between - $\int$ for original palatals and $-£$ for secondarily derived ones is noted by Nishi (1997:979-80;992) to be a recent development with the latter rarely occurring in the later inscriptions and being so far unattested in the earlier ones. Consequently, in spite of the lack of orthographic distinction where both are attested as $\odot-$, Nishi (1974:16) is able to make a distinction between $c$ - and $c j$ - in Old Burmese which concurs well with Matisoff's distinction (1969:157) of dental ts- and palatal $c$ - in Lolo-Burmese. In the

[^30]reconstruction here a transcription of $c$ - and $c j$ - will be maintained due to the assumption that it is the palatal medial $-j$ - rather than any inherent palatal features of the initial that caused the coda fronting; this will be discussed further below.

### 2.3.1.4 Old Burmese nj- / tj-and Inscriptional/Written Burmese $n-/ c$ -

Words beginning with $20-n$ - in Written Burmese are not numerous; when those of demonstrable origin in $\eta j$ - are removed, the list becomes even smaller and suggests that the remaining cases of $\eta$ - may be derived from $n j$-. Further research is required to confirm this but the curious distributional anomaly with $\varnothing-c$ - appearing in both initial and coda position but $-\eta$ only in coda position will be seen in 3.5 .1 to be paralleled in Old Chinese, and significantly $-t$ and $-n$ only occur as codas after $n$ - when the rhyme is labialised via medial $-w$ - which may have inhibited the spreading of the palatal feature. Evidence for a shift of $n j$ - to $n$ - may be found in correspondence sets like Night (\#31) with Northern Chin *jan ${ }^{\text {III }}$ night $n$ corresponding with Burmese nill 2ల§ nan ${ }^{\text {III }}$ night n, or Low, Soft (\#99) to account for a possible association between
 inferior vi.

Some cases of $c$-, but not all due to the attestation of $c j$-, may possibly be similarly derived from $t j$-. There are in fact a few cases of o्रj- $t j$ - in Written Burmese but Nishi (1974:19) treats them as peripheral to the Old Burmese phonological system and (1974:43) specifically criticises Matisoff's use (1972a:30) of the variant spelling
 reconstructing a Lolo-Burmese ${ }^{*} d j-{ }^{78}$

### 2.3.1.5 Inscriptional Burmese ${ }^{h_{j}} / h_{j}-/$ sj- and Written Burmese ${ }^{h} r$ -

Nishi (1999:675) shows Written Burmese @- ${ }^{h} r$ - to fluctuate with several inscriptional forms: © - ${ }^{h} j-$; ©
 Yanson's suggestion (2002b:164) of a Pali origin confirms an original rhotic initial, it

[^31]is difficult to establish the original form. To some of Nishi's cases internal phonological and morphological evidence offers a solution: Yanson (2002c) shows firl Яㄱ $/ \omega^{\circ} \mathrm{hit}^{\text {III }}$ be vi to have developed into Written Burmese ${ }^{h} r$ - via an intermediary stage $h j$ - triggered by an epenthetic medial $-j$ - as was noted to occur with $k$ - before high

 which, as the transitive derivation of jã¹ ๆโ์ $\operatorname{ran}^{\mathrm{I}}$ side-by-side $v i$, should be reconstructed as 乌§ ${ }^{1}{ }^{1}{ }^{1}{ }^{1}$ put side-by-side vt showing coda palatalisation to have occurred after §- ${ }^{h} r$ - had begun shifting toward its modern palatal articulation $\mathcal{f}$ - via upj $h j$ - or cu- ${ }^{h_{j}} .{ }^{80}$ In other cases like eight vi, discussed in 6.5.4, and Ashamed (\#30), external Sino-Tibetan evidence can provide a correct reconstruction.

### 2.3.2 Medials $-l$ - and $-r$ -

### 2.3.2.1 Inscriptional Burmese $-l$ - and Written Burmese $-j-/-r$ -

Disregarding the case of $\eta r$-, for reasons outlined above, the medials $\underset{\sim}{-l}$ - and $E r$ are restricted to $k$-, $p$ - and $m-{ }^{81}$ Cases of $0^{-} h r$ - in Inscriptional Burmese are shown by Yanson (1978, 1994:366-7) to be due to Mon scriptural influence on Written Burmese ๆ- ${ }^{h} r$ - and may be discounted. Nishi (1977:41-3) and Luce (1985:I.106) show that Inscriptional Burmese $-l$ - merged with $-j-j$ - after velars but $-r$ - after bilabials in Written Burmese before all ultimately merging as $-j-:^{82}$

[^32]
### 2.3.2.2 Inscriptional Burmese -lj-

There are a few cases in the inscriptions where the medial combination $-l j$ - is attested. Nishi (1977:43-5) suggests that after velars this generally seems to reflect the change $-l->-l^{j_{-}}>-j$ - but that after bilabial initials $-l j$ - also appears to shift to $-j$ which contradicts the general shift of $-l$ - to $-r$ - in that environment. He tentatively suggests that in such cases the original medial combination may have been $-l j$ - as attested in words like mjov ${ }^{\text {II }} \varrho_{\|}{ }^{\circ}$ mjiw ${ }^{\text {II }}$ seed, type, lineage $n$ which occurs in the inscriptions variously as $\overbrace{0}^{2}\left[\delta\right.$ mliw or ${ }_{c}{ }^{2}$ lateral $l$ - could support a medial $j$ - suggests that $p l j$ - or $m l j$ - clusters, which as discussed in 3.5.2 stem from a Sino-Tibetan bilabial prefix, add support to Nishi's hypothesis. This analysis could also be extended to velar initials but the general shift of medial $-l-$ to $-j$-, rather than $-r$-, in such an environment has obscured any evidence for this which will only now be discovered through external comparisons.

### 2.4 Tonality

### 2.4.1 Suffixal -1 and -s

Although tone III is marked generally, but inconsistently, in the inscriptions as $\frac{C}{33}-1$, the lack of marking of tones I and II makes an analysis based on orthographic distinctions rather difficult. However, following the evidence in the Ajāwlat Inscription, discussed in Pe Maung Tin \& Luce (1960:239-50) and Luce (1969-70:I.111-3), where tone II appears to be often marked with -u์ -h, Egerod (1971:1689) and Pulleyblank (1978:175) note a similarity with the proposals that Middle Chinese tones are marked by glotalic and breathy phonation from Old Chinese origins in -1 and $-s$ as discussed in 3.3. However, Weidert (1987:83) notes that the creaky glottalic phonation of Burmese tone III appears to correspond to the glottalic feature of Chinese tone II while the breathy phonation of Chinese tone III appears to correspond to the breathy phonation of Burmese tone II. Consequently, when compared with the Sino-Tibetan tonal categories, established in the introduction to Chapter 6, there appears to be a curious flip-flop of tones II and III in Burmese:

|  | SB | WB | IB | ST |
| :---: | :---: | :---: | :---: | :---: |
| I | $\dagger$ (low) | - | - | - |
| II | 1 (high) | -: | -טर्ט (-h) | -? |
| III | $\pm$ (creaky) | -. | $\frac{¢}{m}(-3)$ | $-s>-h$ |

Further compounding the evidence for an original $-h$ in tone category II is the fact that Written Burmese consistently uses the Sanskrit visarga-: to mark this category which also represents $-h$. The issue is additionally obfuscated by the evolution of modern spoken Burmese for which Nishi (1997:993-4), presumably following Henderson's (1952:151) observations on Khmer, suggests that concomitant with breathy voice would be a lower pitch such that tone II should have been lower pitch than tone I with normal voice. Although Matisoff (1979:19-20) and Yue-Hashimoto (1986) show suprasegmental tonal flip-flops of this nature, as opposed to a segmental flip-flop as the Inscriptional evidence would imply, to be not unknown in Sino-Tibetan, the curious implication of sequential flip-flops in the evolution of Burmese suggests the analytical procedure must be faulty.

Dealing first with Nishi's observation, Sagart (1986:90, 1988:84) provides evidence from many peripheral Chinese dialects to suggest that an original segmental $-s$ may be better associated with creaky phonation. Pulleyblank (1986b:78-80) suggests Sagart's proposal to be phonetically implausible and suggests that there must have been at least some kind of intermediary $-h$ period; Pulleyblank's opinion is later espoused by Sagart (1999b:132-3) who brings further dialect evidence to support this. The difficulties with the orthographic evidence are addressed by Button (2005:7) who, following Pe Maung Tin \& Luce's (1960:243) and Sawada's (2003:330) observation that $-0 \mathcal{\delta}-h$ is generally only used to mark tone II in conjunction with short vowel symbols which are usually reserved for glottalic tone III in open syllables, remarks that the situation is very reminiscent of Shorto's comment (1976:1060) that in the Mon inscriptions vowel length distinction was neutralised before $-h$ and -2 . Button consequently opines that the transcription of short vowels with $-v$. $-h$, alongside short vowels with glottal, was simply a borrowed transcriptional convention from Mon devoid of phonological significance. ${ }^{83}$ As for the later use of visarga, this was only

[^33]applied after long vowels and although it may well, as Bradley (1982:123) and Wheatley (1995:453) suggest, represent a discernible breathy phonation sometimes associated with modern spoken Burmese tone II, this certainly cannot be transferred back to Old Burmese as Lehman (1992a:236;240) and Nishi (1997:993) attempt. Further support comes from Sawada's remark (2003:346) that if breathy phonation had been a clearly discernible feature of tone II, then Inscriptional Burmese could have marked it with $\frac{\Pi}{\mathrm{J}}$, or a subscript version of $-0 \mathcal{\delta}-h$, in the same way that $\frac{\varepsilon}{\mathcal{s}}$ was used to glottalically mark tone III; as it stands only the Ajāwlat inscription shows any attempt to mark the category at all. Consequently Haudricourt's proposal (1975:342) to derive Burmese tone II from $-s$, along similar lines to Egerod and Pulleyblank above, is unlikely; this supports Matisoff's specific rejection (1982:8;45) of Pulleyblank's proposal due to a lack of a correlation with $-s$ elsewhere in TibetoBurman. Interestingly, Matisoff (2003:478) restates this position but adds the observation that the few Tibeto-Burman words he reconstructs with final or suffixal -s may have merged with Lolo-Burmese tone II; an account for this is made in 5.2.7.

### 2.4.2. Prefixal s-

Contrary to the suffixal $-s$ hypothesis postulated above, Thurgood (1981) proposes that Burmese tone III may have developed from a prefixal $s-$. Matisoff (1982:45) and Benedict (1983:16) are supportive but Jones (1986:136) prefers the conservative assumption that it derived from a glottal suffix which, following the above discussion, may now be treated as derived from an original suffixal $-s$. An argument by Thurgood $(1981: 43 ; 49)$ that seems to have been overlooked is that the proposal is only made for certain tone III verbs with tone I provenances such that all other cases are attributed to the same unidentified source as Lolo-Burmese tone III for which, as Thurgood notes, a separate account must be made. Weidert (1987:156) points out that Thurgood's proposition (1981:49), that prefixal $s$ - must have caused creaky tone III development at a time prior to the aspiration of initials by $s$-, as evinced by the many verbs in tone I with aspirated initials and tone III with unaspirated initials, makes his prefix theory hard to accept. ${ }^{84}$ Benedict (1983:15-16) attempts to distinguish, in Burmese and Chin, between root clusters beginning with $s$ - that gave aspiration and root initials with $s$ -

[^34]prefixes that gave tone III but then is unable to account for Burmese verbal forms with both aspiration and tone III. Furthermore, the implicit assumption in Thurgood's work is that tone II verbs do not have tone III counterparts but correspondences like $p^{h} \tilde{r a}^{11}$
 wê pile/stack up vt suggest this also may not be the case. Thurgood's work is nonetheless of paramount importance because it establishes in Burmese a clear association of transitivity/causativity with tone III as well as with initial aspiration; this is something that is well-attested in Northern Chin, as discussed in 7.1.5 and 7.4, and supports Sun's association (1999:194-5) of both prefixal $s$ - and suffixal $-s$ with causation in Tibeto-Burman languages. Sun suggests that the suffixes are derived secondarily from the prefixes but it seems rather that the two processes are distinct but

 apparent cases of concomitant $s$ - prefixation and $-s$ suffixation more likely stem from discrete processes acting at separate stages on the language. A further valuable contribution of Thurgood is his association of verbal nominalisation with tone III (1977:687, 1981:67-69) which is also attested in Northern Chin as discussed in 7.3.

[^35]
## Chapter 3: Old Chinese

Along with Old Burmese, as discussed in the introduction to Chapter 2, Old Chinese has similarly been the focus of rather inconsequential discussions regarding the validity of the literary tradition in its reconstruction. ${ }^{86}$ To Miller's dismissal (1975:1237-43) of the Shijing as ambiguous in its rhyming, and the Qieyun and Yunjing as being divorced from real language, Pulleyblank (1984a:74), focusing on the Yunjing, counters that modern dialectal evidence shows genuine correspondences to the divisions attested there, and Sagart (1999b:10) notes that that the main distinguishing features of modern Chinese dialects emerged after the migrations occurring no earlier than the $2^{\text {nd }}$ century BC such that the comparative method simply cannot reach the time depth of the Shijing. More recently, Miller's mantle has been taken up by Norman \& Coblin (1995) who take particular objection to the proposals in Pulleyblank (1984a) that Middle Chinese may be divided into Early Middle Chinese, corresponding to the distinctions in the Qieyun rhyme dictionary, and Late Middle Chinese, codified in the Yunjing rhyme table. In particular, Norman \& Coblin (1995:578-82) suggest the following: the Qieyun is of little value due to it being an amalgamation of northern and southern dialects rather than a real language; the Yunjing, compiled as a key to the Qieyun, is by no means necessarily representative of a Tang koine. Sagart (1999b:9) notes that the only real difficulty concerning the weight accorded to the literary tradition instead of the vernacular by the Qieyun is the lack of evidence for iambic prefixes, ${ }^{87}$ while Pulleyblank (1998b:204-6) cites dialectal evidence as well as Tang linguistic commentaries and transcriptions in support of a koine. Norman \& Coblin's plea, restated in Coblin (2003), for renewed vigour in Chinese dialectal research is commendable but this will almost certainly be confirmatory, with additional insights, of what is already known about Old Chinese rather than antithetic.

### 3.1 Vocalism

### 3.1.1 Baxter's Six Vowel and Li's Four Vowel System

Rather than pitting his six-vowel $i, u, \partial, e, o, a$ system of Old Chinese at loggerheads with Li's four vowel $i, u, \partial, a$ and three diphthong $i a, u a, i z$ system, Bodman (1980:47)

[^36]suggests that it simply represents an earlier stage than Li's Old Chinese. Bodman's implicit assumption of vowel-breaking between his and Li's system is confirmed by Baxter's explicit correlation (1980:8-9) of Li's $i a$ with Bodman's $e$ and of Li's $u a$ with Bodman's $o$; Li's io essentially gives $i$ in Bodman's system ${ }^{88}$ and, were Li to have reconstructed $\boldsymbol{u}$, it would have correlated with Baxter's $u$. Li does not reconstruct $u a$ due to his observation that rounded syllables in such rhymes seem to be generally confined to coronal initials and codas which appear to have rounded a to uo. ${ }^{89}$ The conditioning environment is unclear and Baxter (1992:251-5) resolves the problem by noting that before coronal codas, syllables with coronal initials are in complementary distribution with syllables with velar initials in their Middle Chinese reflexes such that he is able to derive all of Li's rounded Middle Chinese cases from an $u$ vowel and all of Li's $i z$ cases from $\partial$. Baxter's observation restores balance to Li's system due to $\mathrm{Li}(1974: 264)$ having to reconstruct $u a$ as a temporary measure to account for rounded vowels with coronal initials and codas to differentiate them from unrounded vowels in the same environments. However, on the basis of Shijing rhyming, Li rejects Yakhontov's proposal (1970:65), adopted by Baxter (1992:23640), to treat it as $o$. It is likely that Li would also reject Baxter's treatment (1992:2407) of his corresponding unrounded $i a$ as $e$ in the Shijing.

Baxter's reconstruction of separate rhyming categories in the Shijing represents the fundamental point of difference from Bodman's system on which it is based. ${ }^{90}$ The statistical evidence presented by Baxter for his $e$ and $o$ rhymes, which he further extends to $i$ and $u$ to create an even distribution of vowels before final codas, is questioned by Pulleyblank (1994b:167) on the basis of the requirement for several special exceptions. In response to Yakhontov's proposals, Pulleyblank (1963:209) makes the alternative proposal that the rounding of wa to $o$ and wo to $u$ may rather be a feature of the Shijing dialect that had a tendency toward rounding but did not practice it exclusively. Baxter (1992:839) admits that this accounts for the evidence but counters that this requires a distinction of $\mathrm{k}^{\mathrm{w}}$ an and kwan to be made in the reconstruction corresponding to his $\mathrm{k}^{\mathrm{w}}$ an and kon. In Li's system this is distinguished as $\mathrm{k}^{\mathrm{w}}$ an and kuan in much the same way as Matisoff (2003:25) attempts to distinguish

[^37]$k^{w}$ - and $k w$ - in his Tibeto-Burman reconstructions. ${ }^{91}$ Consequently, while Baxter's new divisions of the Shijing rhymes on the basis of rounding and fronting are relatively well supported statistically, it is unlikely that this represents anything more than distinctive rhyming practices in the Shijing, perhaps influenced by idiosyncrasies of the Shijing dialect. Nevertheless, following Baxter's initial attempts (1994a), Matisoff (1995:36) is eager to associate his five vowel $i, u$, $e, o, a$ Tibeto-Burman system with Baxter's six vowel Old Chinese system ${ }^{92}$ where $a$ is assumed to have merged with $a$ in Tibeto-Burman. ${ }^{93}$ The fuzziness of the correlations, as similarly noted by Sagart (1995a:248), appears to have led Matisoff (2003:xii) to default back to Karlgren's (1957) system. Although Sagart (2006a:217-8) is justified in chastising Matisoff for reverting back to such an out-dated system in light of the significant advances in the field since Karlgren's time, it appears that, erroneous comparisons aside, the major stumbling block is a persistence of scholars in assuming that a triangular vowel system is somehow more natural. ${ }^{94}$

### 3.1.2 Pullevblank's Two Vowel System

Treating Baxter's pure vowels as diphthongs in Li's system could be superficially viewed as a sleight-of-hand devoid of phonological significance to simply achieve a smaller vowel set. Yet, Li's system also has distributional difficulties whereby $i$ only occurs before dentals or velars and $u$ only before velars. By reconstructing palatal $-c /-$ $n$ codas in addition to labiovelar $-k^{w} /-\eta^{w}$ codas (1977-8:187-94), ${ }^{95}$ Pulleyblank is able to remove the distributional anomalies in Li's system to reduce Li's four vowel Old Chinese system to just $\partial$ and $a .{ }^{96}$ Pulleyblank accounts for Li's diphthongs $i a$ and $i a$ with a freely occurring medial $-j-{ }^{97}$ to which, contrary to Li's evidence against its reconstruction (1974:238) and Pulleyblank's proposals for metathesis discussed above,

[^38]may now be added a freely－occurring medial $-w$－to account for Li＇s $u a$ and by extension $u \partial^{98}$ This leaves a $\partial / a$ vowel system with medial $-j$－and $-w$－that perfectly parallels the proposal for the development of Old Burmese as discussed in 2．1．4 and 2．3．1．Baxter（1994b：153－4）criticises Pulleyblank＇s assignation of the palatal and labial features to the surrounding segments rather than the vowels on typological grounds；comparative Tibeto－Burman evidence aside，his suggestion that a similar procedure could be applied to his system but is unwarranted，may be challenged by some of the distributional gaps in his system that will be discussed below．

## 3．2 Codas

The system for Old Chinese rhymes follows that of Pulleyblank（1977－8：202－3）． Pulleyblank＇s more recent proposals for labiopalatal codas（1991a：47，2004：150－9） which concomitantly remove uvulars from the system，albeit with some reshuffling of correspondences，are not adopted here for want of better evidence in light of the newly emerging evidence for uvular initials in Old Chinese and Sino－Tibetan．${ }^{99}$

|  | Yin | Yang | Ru |

| X | 侯－aw | 東 $-a \eta^{\text {w }}$ | 屋 $-a k^{w}$ |
| XI | 霄 $-a k$ |  | 樂 $-a q$ |

[^39]The reconstructions of $-m,-p,-n,-t,-k,-\eta$ are supported by Li (1974) and Baxter (1992); the other codas will be discussed below.

### 3.2.1 Laterals

The proposal for an Old Chinese $-l$ coda comes from Schuessler (1974a:82-4) who notes xiesheng ${ }^{102}$ and rhyming contacts with $-n$ and Tibeto-Burman comparanda in $-l$. Developing his previous observations of Tibeto-Burman comparanda in -l (1962:2156), Pulleyblank (1977-8:185-6) follows Schuessler to further propose that $-l$ merged with $-j$ very early on; this is preferable to Baxter's reconstruction of an original $-j$ for which a rather arbitrary denasalisation of $-n$ to $-j$ is proposed to account for the xiesheng links with $-n$ (1992:294;414). Regarding the $-n /-l$ interchange, Pulleyblank (1993a:363) notes a difficulty in accounting for the Tibeto-Burman $-r$ coda and makes the tentative suggestion that $-r$ may have developed dialectically into Old Chinese $-n$ or $-l$. This proposal mirrors one by Starostin (1989:338-41) although, like Baxter, he treats Pulleyblank's $-l$ as $-j .{ }^{103}$ Starostin's proposal is adopted by Baxter (1995:1) following his comment ( $1994 \mathrm{~b}: 156$ ) that Sino-Tibetan comparanda in $-l$ do not necessarily imply that the coda had not shifted to $-j$ by the time of Old Chinese. ${ }^{104}$ Baxter's remark is valid but the discussion in 5.2.2, that suggests a similar shift of $-l$ to $-j$ to have occurred in Northern Chin, certainly favours Pulleyblank's reconstruction which allows for a more even distribution of the Old Chinese $-j$ coda as will be discussed below.

### 3.2.2 Palatals

In addition to where his $-j$ corresponds to Pulleyblank's $-l$, Baxter reconstructs a third rhyme $-i j$ that corresponds to Pulleyblank's -aj but then reconstructs an open vowel counterpart $-e$ to correspond to Pulleyblank's $-a j$. Baxter (1992:292) wants to reconstruct $-e$ to allow all his vowels to appear in syllable-final position but this requires him (1992:578-9) to apply a rule of $-j$ insertion after $-e$ to give Middle Chinese $-e j$ (Pulleyblank's $-\varepsilon j$ ). Pulleyblank (1993a:361-2) observes that

[^40]reconstructing an original $-j$ coda would not require any arbitrary rules but that Baxter is constrained by theoretical considerations．Pulleyblank＇s proposal for a palatal series （1977－8：190；1997：12－6）takes Hashimoto＇s proposal（1970：336－362）to reconstruct Middle Chinese palatal codas $-\Omega$ and $-c$ in the Late Middle Chinese 梗 $-a j \eta / k$ rhyme group back to the Old Chinese level．${ }^{105}$ As Pulleyblank points out，this is a natural progression in light of Old Chinese $-a n$ and－ac being the most common source of Middle Chinese 梗－ajy／k，the lack of an＇inner＇rhyme group（i．e．without a low $a$ nucleus）corresponding to the 梗 rhyme is accounted for by the coronalisation of the codas from the rhymes－ən and－ac．Baxter（1992：422－5；434－7；451－2；491－500） reconstructs the palatal series as $-i j,-i n,-i t$ and $-e,-e \eta,-e k$ respectively which prompts Pulleyblank（1993a：369）to note the distributional lack of $-i$ ，$-i \eta$ ，$-i k$ in Baxter＇s system．Baxter tentatively suggests（1992：563）that $-i$ may have merged with $-i j$ ，and follows（1992：299；301）Li＇s proposal（1974：274）for a merger of－iy and－in by the time of the Shijing to further suggest a similar merger of－ik and－it．The distinction of $-i$ and $-i j$ as an artificial phonological recourse of historical linguists rather than a representation of any phonetic reality is discussed in 2．1．3．2 and the introduction to Chapter 5；the difficulty with Li＇s proposal is discussed by Pulleyblank（1982a：250－ 3）．${ }^{106}$ Hashimoto＇s proposals for palatal codas combined with the Burmese evidence， cited by Pulleyblank（1977－8：195－6）and discussed in 2．1．3．3，makes Pulleyblank＇s proposal for a palatal series convincing．

## 3．2．3 Velar Glides

Pulleyblank＇s reconstruction of a possible glide $-u_{l}$ where Baxter reconstructs open vowels is a relic of the disfavoured voiced stop hypothesis essentially used by

[^41]scholars like Li to account for contacts between $r u$ rhymes in $p,-t,-k$ and their corresponding yin rhymes. ${ }^{107}$ For $\mathrm{Li}(1974: 249)$ this represents little more than a notation rather than an explanation but the solution is provided by Haudricourt (1954b:364) who, noting the yin rhymes are usually in tone III which he attributes to an $-s$ suffix, proposes that the $-p / t / k$ finals may have developed glide-like articulations, corresponding to the yin rhymes, under the influence of this suffix. ${ }^{108}$ Pulleyblank (1962:216-221, 1973b:371) bolsters Haudricourt's proposal by providing specific transcriptional evidence for $-s$ in words originally developed from a $-t s$ cluster. ${ }^{109}$ Pulleyblank (1977-8:186-7) justifies his retention of the glide after 2 on the basis of Tai loanwords, for which $\mathrm{Li}(1945: 341)$ believed the development of Old Chinese $-g$ into the vowel $-u$ was responsible, and (1995c:298) that the natural fronting of $-u_{l}$ to $j$ between Old Chinese and Middle Chinese avoids having to apply an arbitrary rule of $-j$ insertion as Baxter (1992:578-9) is forced to assume; the evidence for $-u_{l}$ after $a$ is less forthcoming, particularly in light of the open vowel -a in Tibeto-Burman, but he notes (1995c:298) occasional xiesheng and rhyming contacts with velars. Nevertheless, the fact that universally reconstructing - $u_{l}$ leaves Old Chinese with no open syllables makes Pulleyblank's suggestion (1995c:297-8) that it may simply represent a case of epenthesis used to make isolated syllables well-formed likely. In the Old Chinese reconstructions provided here, Pulleyblank's $-u_{l}$ is omitted for simplicity.

### 3.2.4 Labiovelars

The existence of labiovelars in Old Chinese is relatively uncontentious; the specificities are less so. Baxter's proposal (1992:302) for a single labiovelar stop affords it a very limited distribution and no nasal counterpart. Recognizing the issue, Baxter (1980:16) attempts to treat it as a $-w$ coda followed by a glottal stop $-?$ which later becomes $-k$, but the evidence discussed below, that a glottal stop was the source of tone II, forces Baxter (1992:302) to reluctantly maintain this isolate. Li also

[^42]reconstructs $-a k^{w}$ but balances this out with $-\partial k^{w}$ in his system corresponding to Baxter's $-u k$. The discussion under 3.2.5 below shows Pulleyblank's reconstruction (1977-8:197-9) of -aq for Li's and Baxter's $-a k^{w}$ to account better for the Middle Chinese reflexes; ${ }^{110}$ this leaves Pulleyblank able to reconstruct $-a w,-a \eta^{w},-a k$ for Baxter's $-o$, $-o \eta$, -ok and similarly $-\partial w,-\partial k^{w},-\partial \eta^{w}$ for Baxter's $-u,-u \eta,-u k$. Li's reconstruction of $-\partial g^{w \prime},-\partial k^{w},-\partial \eta^{w}$ for the latter is unproblematic ${ }^{111}$ but his reconstruction of $-u,-u \eta,-u k$ for the former needs to be addressed. Pulleyblank (19778:195, 1979:30) notes that, in spite of its Middle Chinese reflexes, there is strong internal and external evidence that Li's $-u,-u \eta,-u k$ corresponds to a low vowel in Old Chinese. The similar development of both in Middle Chinese is corroborated by the evidence in 5.2 .6 suggesting that $-\partial w,-\partial k^{w},-\partial \eta^{w}$ and $-a w,-a k^{w},-a \eta^{\prime \prime}$ have merged in Burmese and Northern Chin.

### 3.2.5 Uvulars

The benefits of Pulleyblank's reconstruction (1977-8:197-9) of $-a q$ and $-a b$ where Baxter has $-a k^{w}$ and $-a w$ are two-fold: it accounts for the lack of a typologically unusual uvular nasal that corresponds to a missing -a $a \eta^{w}$ in Baxter's system; it better accounts for the variations in labiality of the Middle Chinese reflexes which are usually unrounded when derived from -aq ${ }^{112}$ but always rounded when derived from $a s$ for which Pulleyblank (1977-8:199) suggests a development of $-a s>-a \beta>-a w .{ }^{113}$ Pulleyblank's concerns (1982b:209) that his inability to find solid external evidence for uvular initials makes it difficult to reconstruct them as codas with any certainty, ${ }^{114}$

[^43]may now be allayed by Sagart's proposal (2007), to be discussed below, for uvular initials in Old Chinese.

### 3.3 Tonality

The three tone system of Old Chinese, with tones I and II as basic and tone III as derived, ${ }^{115}$ corresponds to the Old Burmese and Northern Chin evidence discussed in 2.4.1 and the introduction to Chapter 6 respectively.

### 3.3.1 Tone III from -s

The origin of tone III in suffixal $-s$ is proposed by Haudricourt (1954b:346) on the basis of his observations of similar developments in Vietnamese (1954a:70-78) and is relatively uncontroversial. ${ }^{116}$

As a derived tone, Downer (1959:267-9) distinguishes several categories for tone III in Classical Chinese. His inability to isolate a specific grammatical function leads him to propose (1959:262) that any regularity attested in his categories may be fortuitous with derived forms essentially being created on a need-by-need basis; he distinguishes this from the inflectional system of Indo-European. The scarcity of forms in many of Downer's latter categories allows Mei (1980:434-9) to reduce the categories to three predominant ones: verbs to nouns; nouns to verbs; endoactive verbs to exoactive verbs. He further proposes (1980:438) that the change of nouns to verbs may be attributed to analogy at a later stage. Sagart (1999b:133) appears to favour Mei's approach but Schuessler (1985) uses pre-classical evidence from Early-Zhou Chinese to question Mei's separation of Old Chinese into distinct layers; he follows Downer's proposal that his categories are coincidental amalgams (1985:349) to suggest that they obscure an underlying unilateral inversion of attention flow underlying all these tone III derivations (1985:361). The desirability of Schuessler's proposal is that it attributes a single function to the $-s$ suffix believed to have triggered the derivations; the

[^44]difficulty lies in its counterintuitive treatment of $-s$ as an intransitiviser (1980:349) with causativisation being curiously treated as something "which flows naturally from its intransitive character" (1980:354). The main obstacle to conciliation with Mei's proposals, is Schuessler's identification of verbal derivations from nouns in EarlyZhou Chinese that runs counter to Mei's proposal for analogical development post Classical Chinese. The force of Schuessler's argumentation is strong enough that Mei (1989:47-8) is persuaded by it. Yet, whatever the significance of analogy in tone III derivations may have been, ${ }^{117}$ several examples in the Northern Chin data (e.g. *pol ${ }^{1}$ group $n$, associate vi only retaining its form 2 derivation pol $^{\text {III }}$ for the verb in Tedim such that it superficially appears to derive from the noun) show that the perceived association between a noun and a derived verb may rather reflect the loss of an original underived verb rather than any direct correlation between the two. The significance of this is that the role of tone III as a nominaliser and transitiviser/causativiser of verbs in Chinese corresponds perfectly with its identical functions in Northern Chin and Burmese.

### 3.3.2 Tone II from -?

The source of Chinese tone II in a glottal stop -? is first suggested by Pulleyblank (1962:225) via analogy with Haudricourt's proposal for Vietnamese (1954a:80-1). Mei (1970:88-97) develops Pulleyblank's proposal by providing three specific sources of evidence: preservation of glottality in some coastal, predominantly Min, Chinese dialects; Buddhist transcriptions and tonal commentaries; Sino-Vietnamese loans. The faint glottalic nature of tone II in open vowels in Zo is noted in footnote 42 and provides some additional confirmatory evidence to that presented by Mei; the apparent contradiction of Burmese creaky tone III being associated with Chinese tone II rather than III was discussed in 2.4.1. Schuessler (2007:48) suggests an occasional association between tone II and enodactive verbs or nouns; the very limited evidence that tone II may sometimes have been suffixal in origin like $-s$ for tone III is discussed in Sagart (1999b:133-4). A few comparative sets showing similar alternations in Northern Chin and Old Burmese are discussed in 6.4.

[^45]
### 3.4 Type A and B Syllables

The syllables of Middle Chinese are classified in the Yunjing via a system of four divisions; the third of these represents approximately half the lexicon and is generally distinguished from the others by its palatal fanqie spellers. ${ }^{118}$ Noting the inherent improbability of Karlgren's proposal (1954:248) that in Old Chinese all of these syllables could have had a medial $-j$-, Starostin (1989:328-9;516-7) proposes a prosodic distinction whereby short vowels develop into these Type B syllables in contrast to long vowels in Type A. ${ }^{119}$ Starostin bases this proposal on the surface length distinctions in Mizo with which he believes there to be a significant correlation. Baxter, who initially follows Karlgren in reconstructing medial $-j$ - (1992:269), adopts Starostin's proposal (1995:1), ${ }^{120}$ but Pulleyblank (1994a:91; 2001:32) rejects it on phonological and statistical grounds. Interestingly, Starostin's proposal represents the inverse of a former suggestion by Pulleyblank (1962:98-100) that long vowels may be the source of Type B syllables. Pulleyblank is unable to find any supporting evidence for this, but later (1994a:91-3, 2001:27), following Stern's proposal (1963:228-9) for syllabic peaking in Sizang, discussed in 1.4, suggests that syllabic peaking on the vocalic nucleus, that concomitantly surfaces as vowel length in Sizang, corresponds with Type B syllables. Phonologically, Pulleyblank's proposal that type B syllables with falling accents, or syllabic peaking on the vowel nucleus, develop the vowel $i$ has much to favour it; his Early Middle Chinese distinction between syllables derived from Type A with a plain $\partial$ or $a$ nucleus and those from Type B with a high vowel nucleus $i, \dot{i}, u$ that either replace $a$ or form a diphthong with $a$ (1973a:118-9) is supported by the development of $i$ into $i$ and $u$ when occurring in a palatalizing or labializing conditioning environment (1994a:79-81). Statistically Pulleyblank's proposal is less sound: Pulleyblank only lists four comparanda, limited to numerals, of which eight and nine may be discounted due to Stern's faulty analysis of diphthongs, as well as six due to Stern's mis-transcription (1963:240) of it with penultimate stress. ${ }^{121}$ Furthermore, Pulleyblank's proposal is essentially the inverse of Starostin's

[^46]proposal, and it is unlikely that all of Starostin's comparisons, flawed as several may be, are wrong.

Although surface vowel length in Northern Chin is generally consistent, it seems that Matisoff's assumption (2007:440) that it is unlikely to be related to the Old Chinese Type A/B distinction is correct. Sagart (2006a:213), who is less dismissive of the possibility but aware of the apparent exceptions, more recently (2007:1), and along with Baxter (2005a:41, 2005b:7), uses a doubled initial consonant to mark Type A syllables; this is premised on Norman's proposal that the distinction developed from a contrast involving initials (1994:403-5). ${ }^{122}$ A more damning piece of counterevidence against Starostin's and Pulleyblank's proposals is found in 6.1 where it is shown that, bar a few exceptional forms, there is an intrinsic association between tone II, specifically in its modification as IIb, and long vowels with obstruent codas. In his "redundancy-free" representation of Mizo, Weidert (1975:4-8) removes a vowel length notation from syllables with obstruent codas suggesting that vowel length is a concomitant realisation of tone; Lehman's logical counter (1978:720) that the argument could be inverted to treat syllabic shortness as the generator of reduced tone in checked syllables is relevant only if one disregards Weidert's latter observation (1975:11) that long checked syllables outside of tone IIb are mostly phonoaesthetic in origin. ${ }^{123}$ The fact that Weidert's reductionism cannot account for vowel length in syllables with sonorant codas suggests that any association with surface vowel length before obstruent codas may only be superficial and that the actual source of contrastive surface vowel length must lie elsewhere; this casts doubt on any association with Chinese Type A or B syllables which are not restricted in this manner.

### 3.5 Initials

### 3.5.1 Pure Initials

The reconstruction of Old Chinese initials is incredibly complex and still not wellunderstood. To the system of Sagart (1999b:25-42), which is generally adopted here,

[^47]Sagart's further proposals (2006a:212; 2007) for uvulars are added in spite of Matisoff's concerns (2007:439) regarding their reality in Sino-Tibetan. ${ }^{124}$ Sagart's reconstruction of uvulars accounts for xiesheng alternations between Middle Chinese $3-, x-, \gamma^{125}, j$ - and their common occurrence in xiesheng series with velars. ${ }^{126}$ The alternation of velars with ?- was actually one of Pulleyblank's tentative suggestions (1977-8:198) for evidence of uvular initials in Old Chinese. In the table below, Sagart's ts ${ }^{(l)}$ - and $d z$ - are treated as $c^{(h)}$ - and $\mathcal{j}$-:

| $k$ - | $k^{k}-$ | $g$ - | $\eta-$ | ${ }^{h} y$ - | $x-^{127}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $k^{w}$ - | $k^{w h}{ }_{-}$ | $g^{w}$ - | $\eta^{w}$ - | ${ }^{h} \eta^{w}$ - |  |
| $c$ - | $c^{h}$ - | j- |  |  |  |
| $t$ - | $t^{\prime \prime}$ - | $d-$ | $n-$ | ${ }^{n}$ - |  |
| $p$ - | $p^{h}$ - | $b$ - | $m$ - | ${ }^{4} m$ - |  |
| $r-$ | ${ }^{h_{r}}$ |  |  |  |  |
| $l-$ | ${ }^{4}$ - |  |  |  |  |
| w- | ${ }^{h} w$ |  |  |  |  |
| $s$ - |  |  |  |  |  |
| 2- |  |  |  |  |  |
| $2^{w}$ - |  |  |  |  |  |
|  | $q^{h}$ - | G- |  |  |  |
| $q^{w}$ - | $q^{h w}{ }^{\text {w }}$ | $\mathrm{G}^{W}$ - |  |  |  |

Noticeably lacking from the above table are Old Chinese $n$ - and $j$-: a possible lack of $n$ - in Old Burmese was suggested in 2.3.1.4 which, although failing to account for the deficiency, makes it typologically less unusual; Sagart's proposal (1993:244-5) that Middle Chinese $j$-seems to always be a reflex of Old Chinese $l$-may, following his uvular proposal, be extended to $G$ - in type B syllables. His further suggestion (1995a:251, 1999b:29) that Tibeto-Burman evidence in support of Old Chinese $j$ stems from loanwords reflecting a secondarily derived $j$ - is contradicted by Schuessler (2007:96-7) who, following Baxter's original proposal (1992:202), prefers to reconstruct Old Chinese $j$ - which he believes remained unchanged in Tibeto-Burman. Sagart (1993:244-5) does not dismiss this idea but points out that positive evidence is

[^48]required to prove it, and Schuessler (2007:124) concedes that establishing a clear difference between his $l$ - and $j$ - is somewhat elusive. The discussion in 4.8.2 and the loanwords in 6.5 .4 show no specific evidence for reconstructing Sino-Tibetan ${ }^{*} j$-.

### 3.5.2 Prefixes

Sagart (1999b:63-110) makes a detailed investigation into Old Chinese prefixes. Ting (2002a:200) suggests that only prefix $s$ - and $k$ - are relatively unproblematic; to this may be added the special case of $r$-, to be discussed below, and a bilabial prefix of some kind which is supported by the Burmese evidence in 2.3.2. Examples like min命 miajy ${ }^{\text {III }}<*$ m-'raj ${ }^{\text {III }}$ fate $n$, command $v t$ and $\operatorname{ly} y^{\text {III }}$ 令 liajy $y^{\text {III }}<*^{\prime}$ raj ${ }^{\text {III }}$ command $v t$ show good evidence for a bilabial prefix, although, as is discussed in footnote 81, distinguishing between obstruent and nasal bilabial prefixes is not a simple matter. It should also be noted that examples of velar and bilabial prefixation appear to be mainly limited to liquid initials; this is presumably a reflection of prefixes being able to form clusters with liquid initials in contrast to simply being dropped before other initials. The cases of $s$ - and $r$ - are somewhat different in this respect and will be discussed along with $k$ - in more detail below:

### 3.5.2.1 Prefixal $k$ -

Sagart's proposal (1999b:124-130) to differentiate prefixes via close/fused and loose/iambic juncture provides a neat way of resolving some intractable problems with initials. ${ }^{128}$ This allows him to suggest the following developments between Old and Middle Chinese: ${ }^{129} * k l-/{ }^{*} k r->k-; * k-l /{ }^{*} k-r->l-.{ }^{130}$ Nevertheless, Ting's reservations (2002a:195-199) regarding the implications this has for the monosyllabicity of Chinese characters as regards Shijing metrics cannot be taken lightly. That Old Chinese most likely had pre-syllables is not at issue but, to allay Ting (2002b:404-8) who is not persuaded by Sagart's further proposals (2002:392-6), it is certainly possible that this colloquial feature of the language was dropped in the

[^49]Shijing such that the words were indeed treated as monosyllables; this of course would be isolated to such literary works and would not affect the ability of these presyllables to interact with the root initial as the language developed. The modern dialectal examples discussed in Yang (1977-8:292-4) and Sagart's focus (2001:12734) on $k$ - make it tempting to regard Sagart's iambic proposal as being restricted to this single prefix; this is further supported by the Northern Chin evidence discussed in 4.2.

### 3.5.2.2 Prefixal $r$ -

Old Chinese allows medial $-r$ - to occur after all consonant types. In the development into Middle Chinese, Pulleyblank (1965c:205, 1991b:12-3) notes that this caused retroflexion of coronal initials and in Type A syllables gave diphthongs with $\dot{t}$ after the vowel nucleus. Benedict (1987:30-1) questions the $-r$ - hypothesis on the basis that it cannot be correlated with Tibeto-Burman evidence where medial $-r$ - has a much more restricted distribution. Coblin (1986:13) introduces a notational distinction between Sino-Tibetan $-r$ - and $-\boldsymbol{r}$ : the former is used when both Old Chinese and TibetoBurman reflect the medial; the latter is used when only Old Chinese reflects it. A lack of phonological reality means Coblin's notation provides an account but no explanation for the issue which leads Benedict (1988b:18) to note Coblin's distinction but to refrain from making his position clear. In response to the criticisms by Benedict (1987:30-1), Baxter (1994a:26) notes that Old Chinese medial -r-has a morphological function which may have proliferated via analogy and it may correspond to other Tibeto-Burman phonemes as well as $-r$-. Evidence for a morphological function is proposed by Pulleyblank (1973a:118) and is expanded upon by Sagart (1999b:111-20). Pulleyblank further proposes that Old Chinese medial $-r$ - may correspond to a prefix $r$-, and Schuessler (2007:84) suggests that the Written Tibetan prefixes $g / d$ - and sometimes $s$ - seem to correspond to Old Chinese medial $-r-{ }^{131}$ the dropping of prefixes would further contribute to the paucity of examples of medial $-r$ - in TibetoBurman. ${ }^{132}$

[^50]
## 3．5．2．3 Prefixal s－versus Sagart＇s $N$－and Pulleyblank＇s $a$－

In 2.4 .2 and 7.4 it is shown that aspiration via prefixal $s$－made intransitive verbs transitive in Northern Chin and Old Burmese．Pulleyblank（1973a：117－8）and Sagart （1999b：70－1）note a few cases of transitivisation in Old Chinese via a prefixal $s$－but， following Pulleyblank＇s observations（1973a：114－6），it conversely appears that Chinese more commonly had a voicing prefix that made transitive verbs intransitive． Sagart（1999b：63－73）suggests that，rather than causing aspiration，an $s$－prefix in Old Chinese appears to give distinctive sibilant reflexes in Middle Chinese．Sagart＇s proposal is well－founded but，excluding the case of $\mathrm{s}^{\text {III }}$ 寺 $\mathrm{zi}^{\text {III }}<*$＇s－da ${ }^{\text {III }}$ servant $n$ and S $1^{\text {III }}$ 侍 difill ${ }^{\text {II }}$＊＇d ${ }^{\text {III }}$ accompany，wait upon vt that supports his proposal for nominalisation via $s$－prefixation，there is very little solid evidence of $s$－prefixation before voiced obstruents．This creates an interesting case of complementary distribution whereby，the examples of a transitivising $s$－prefix involve sonorant initials while the examples of an intransitivising voicing prefix in Pulleyblank （1973a：114）and Sagart（1999b：75）involve obstruent initials．

Pulleyblank＇s proposal（1986：9－10）to reconstruct a voicing prefix $a-$ that correlates with the Burmese nominalising $a^{\text {III }}-[\partial-]$ зぇ－prefix reduces any common ground with the Northern Chin and Burmese prefixal $s$－whose purely transitivising function has， unlike suffixal $-s$ ，no nominalising function．Alternatively，Sagart（1999b：77， 2003：759，2006b：64）proposes an unspecified nasal voicing prefix $N$－on the basis that Chinese loanwords in Miao－Yao occur with pre－nasalised stops which，in light of Miao－Yao having a series of voiced stops，must imply that the Chinese stops were pre－nasalised at the time of borrowing．Sagart＇s evidence for the existence of Chinese pre－nasalised stops at some stage in its development is incontrovertible，yet they were perhaps not always of this nature．Superficially Luce＇s proposals（1962a：30，1962b， 1985：II：70－87）for a pre－nasalised velar＂$g$－in Thado，Zo and Tedim，as discussed in 1．5．2，seems to confirm this original nasal prefix．However the morphological alternations in Thado，Zo and Tedim occur between $k$－and $x$－（ $<k^{h}$－）rather than $k$－and ＂$g$－，and furthermore this pre－nasalisation is only attested with the velar $g$－and not with $d$－or $b$－According to Ohala（1983：200），pre－nasalisation of stops often develops in languages as a means to maintain voicing and particularly relevant to the Northern

Chin evidence is Ohala's observation $(1983: 195 ; 199)$ that the further back in the mouth a stop is made, the harder it is for it to accommodate voicing. Consequently Sagart's nasal voicing prefix appears to fare no better than Pulleyblank's proposal.

The idea of a possible association between voiced intransitives alternating with voiceless transitives is originally made by Benedict (1972a:124-5) who notes several examples in Tibeto-Burman languages which he suggests may be somehow associated with the Lolo-Burmese alternations assumed to be derived from a causative $s$ - prefix. Sagart (2006b:66) counters that the lack of evidence in Lolo-Burmese for the voicing alternation is due to it already having pre-nasalised initials. However, if Matisoff's reconstruction (1972a:13-4) of the Lolo-Burmese initials is correct, ${ }^{133}$ then the alternation of plain initialled intransitives and aspirated initialled transitives in Old Burmese actually stems from a Lolo-Burmese alternation of $b$ - and $s-b$ - as the Old Chinese evidence would suggest. Further research is required but the identical morphological patterning of Northern Chin, Old Burmese and Old Chinese makes the hypothesis that Old Chinese voiced stops became voiceless stops when preceded by an $s$ - prefix distinctly feasible.

[^51]
## Chapter 4: Northern Chin Initials

Northern Chin has a three-way distinction of voiceless, voiceless aspirated and voiced obstruents. Accomodating this into Benedict's proposal (1972a:17-8;20-1) for a twoway voicing distinction in Tibeto-Burman is somewhat problematic. Miller (1974:196-7;200) criticises Benedict due to his rationale not being explicit ${ }^{134}$ and Pulleyblank (2000:38) notes a distinction around aspiration to be equally well supported. At the other extreme, Starostin (1989:50-1;61-3, 1995:227) suggests a four-way distinction of voicing and aspiration in Sino-Tibetan on the basis of Norman's proposals (1973) for Min Chinese. Starostin's proposal is adopted in Peiros \& Starostin (1996) but Peiros (1998:215) says it requires further confirmation. Sagart (1999b:24) questions the validity of Starostin's supportive evidence to propose (1984:97, 1999b:25) that the distinctive aspiration of voiced obstruents in Min developed from a sandhi triggered originally by differential phrasal stress placement. Sagart's explanation seems much more plausible and leaves a three-way distinction in Old Chinese, with aspiration only occurring with voiceless obstruents, that parallels Northern Chin. Although aspiration, whether original or conditioned by an $s$ prefix, ${ }^{135}$ and voicing, with Old Burmese devoicing voiced initials and aspirating plain initials, is fairly regular, the miscorrelation of voicing and aspiration with verbal transitivity, discussed in 3.5.2.3, makes specific correlations difficult to identify. The situation with distinctive aspiration of sonorants is even less regular and no attempt is made to disambiguate them here. Unfortunately little more can be said at this stage except perhaps invoking Matisoff's defensive response (1975:165-6) to Miller that the complexity of the system with the loss of many original prefixes, which Peiros (1998:215) readily admits his and Starostin's system does not adequately address, precludes any definitive statements as yet.

[^52]
### 4.1 Velars

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $* k_{-}$ | $k-$ | $k-$ | $k-$ | $k-$ | $k-$ | $k-$ |
| $* k^{-}$ | $k^{-}$ | $k^{h_{-}}$ | $x-$ | $x-$ | $x-$ | $k^{h_{-}}$ |
| $*_{\eta} \eta_{-}$ | $\eta_{-}$ | $\eta_{-}^{-}$ | $\eta^{-}$ | $\eta-$ | $\eta-$ | $\eta_{-}$ |
| $* h_{-}$ | $h_{\eta-}$ | $h_{\eta-}$ | $\eta_{-}$ | $\eta_{-}$ | $\eta_{-}$ | $\eta^{-}$ |

The attestation of $b$ - and $d$ - in Northern Chin leads Ohno (1965:16-7) to suggest that it must be possible on distributional grounds to reconstruct an original $g$ - phoneme but that the actual processes are still unclear. It is tempting to assume that $g$-shifted to $\gamma$ as it did between Old and Middle Chinese ${ }^{136}$ such that, on the basis of the Southern Chin reflexes of $r$ - as $\gamma$-, Sino-Tibetan $g$ - and $r$ - simply merged. While this would be possible for the four more northern languages, in Mizo and Zahau this would assume a circular sound change of $r->\gamma_{-}>r_{-}$where, even if the original articulation is assumed to be $\gamma$-, a change of $\gamma$ - $>r$ - is contrary to the standard shift of coronal $r$ - to a posterior location rather than vice-versa. ${ }^{137}$ The most likely solution is that original $g$ simply devoiced to $k$ - in Northern Chin; the evidence for this comes from the evolution of the velar articulations of $r$-, discussed in 4.3, where the tendency for the velar to lose voicing has led to Tedim and Sizang using the recourse of nasalisation to prevent the change. The explanation as to why Tedim and Sizang did not adopt nasalisation to prevent the devoicing of the original $g$ - as they appear to be doing with the new $g$ - simply reflects different linguistic behaviour at different time periods. In the more northern languages it seems likely that the shift of $g$ - to $k$ - would favour the shift of $\gamma / b^{-}(<r-)$ to $g$ - due to this now being an available slot in the phonemic inventory:

| ST | $N C$ | $O B$ | OC |
| :---: | :---: | :---: | :---: |
| ${ }^{*}$ k- | $k$ - | $k^{h}-1 k-$ | $k$ - $\mathrm{g}^{-}$ |
| $* k^{h}$ - | $k^{h}$ - | $k^{h}$ - | $k^{\prime}-1 / k-$ |
| $\left.{ }_{*}^{*}{ }_{*}^{(6)}\right)^{-}$ | $\begin{aligned} & k-\left(<*_{-}\right) \\ & \left({ }^{(k)} g_{-}\right. \end{aligned}$ | $\left.{ }^{(m)}\right)^{\prime-}$ |  |

[^53]
## [\#1] Bitter

[M] *ka (2003:451)
[P\&S] *g ${ }^{\text {ha: }}$ (1996:\#2039)
$[\mathrm{NC}] \quad{ }^{*}{ }^{\mathrm{h}}{ }^{\mathrm{II}}$ bitter $v i$
A semantic association with ${ }^{*}{ }^{\mathrm{h}} \mathrm{a}^{\text {III }}$ bile $n$ is supported in Matisoff (2004:3578) and discussed further in 7.3.
[OB] $\mathrm{k}^{\mathrm{h}} \mathrm{a}^{\mathrm{II}}$ จ): $\mathrm{k}^{\mathrm{h}} \mathrm{a}^{\mathrm{II}}$ bitter $v i$
[OC] $\mathrm{k}^{\mathrm{h}} \mathrm{u}^{\mathrm{II}}$ 苦 $\mathrm{k}^{\mathrm{h}} \mathrm{o}^{\mathrm{II}}<*^{\mathrm{h}} \mathrm{a}^{\mathrm{II}}$ bitter $v i$
Matisoff follows Benedict (1972a:158;165) in reconstructing an $-n$ suffix to compare gan ${ }^{\mathrm{I}}$ 肝 $\mathrm{kan}^{1}$ liver $n$. Miller (1974:197-8) questions this association both on the phonological requirement for an arbitrary $-n$ suffix as well as on the semantic grounds that liver $n$ has no semantic link with bitter $v i$. The areal semantic associations of liver $n$ are shown to be either with heart $n$ by Wilkins (1996:284) or with bile $n$ by Matisoff (2004:357-8). Although Matisoff (2003:306) suggests an association with bitter vi, discussed under Liver (\#86), there are no phonological grounds for setting up such a comparison here.

## [\#2] Barking-Deer

[M] $\quad{ }^{*}$ kəj (2003:189)
[P\&S] ${ }^{\mathrm{g}} \mathrm{g}^{(\mathrm{li})} \mathrm{ij}(1996: \# 2313)$
[NC] ${ }^{*} \mathrm{~K}^{\mathrm{l} 1^{1}}$ barking-deer $n$

Shafer (1952:148) provides a good individual Mon-Khmer link but the source is most likely Tibeto-Burman due to other Mon-Khmer languages, noted by Shafer (1952:115) and Shorto (2006:461;489), reflecting a separate root. ${ }^{139}$

[^54]
### 4.2 Velar Clusters

Matisoff (2003:145-6) suggests a clear case in Lolo-Burmese for a distinction between the cluster $k r$ - and prefixed $k-r$-. An attempt at such a distinction in SinoTibetan appears to be made by Peiros \& Starostin (1996) for Mizo $t^{(h)}$ - but generally $k r$ - rather than $k$ - $r$ - prevails. ${ }^{140}$ A more useful comparison may be found in their proposal (1996:III.iii) to reconstruct Northern Chin *kl- as a unit phoneme *X- in Sino-Tibetan. ${ }^{141}$ Although Peiros (1998:215) maintains the lateral affricate in SinoTibetan, Starostin (2004:64) more recently revises it to $T-l$-, with $T$ - generally being a morphological prefix of some kind that in most cases may be treated as $k$-, ${ }^{142}$ due to confusion between $t^{\prime}$ - and $l$ - in their Mizo reflexes. This brings Peiros \& Starostin's system more in line with that of Benedict and Matisoff where only one lateral initial $l$ is reconstructed and allows for the following observations: of the twenty-five cases of Mizo $l^{l}$-, nineteen are derived from $T-l$-, four from $l$-, two from $k l$-; of the twenty-four cases of Mizo $t^{l h}$-, nineteen are derived from $l$ - of which two have possible $k$ - prefixes, four from $T-l$-, one from $g^{h} l$. In the latter case, the fact that Peiros \& Starostin do not reconstruct aspirated/voiceless sonorants in Sino-Tibetan accounts for the predominance of ${ }^{*} l$ - with Mizo $t^{l /}$ - generally seeming to be tacitly attributed to some kind of prefixal element before the lateral. The distinction between cluster initials and prefixed initials seems to be an unsuccessful attempt to distinguish between reflexes in other languages always showing evidence for a cluster in the former and those only sporadically so in the latter of which the following two cases are good examples: ${ }^{143}$

[^55]
## ［\＃3］Wind

［M］$\quad$＊g－ləj（2003：192）
［P\＆S］＊lij（1996：\＃1761）
［NC］${ }^{\mathrm{k}}{ }^{\mathrm{h}} \mathrm{li}^{1}$ wind $n$

## ［\＃4］Moon

［M］$\quad{ }^{\text {s }} / \mathrm{g}-\mathrm{la}(2005: 10)$
［P\＆S］＊s－la（1996：\＃1684）
［NC］＊k ${ }^{\text {h }}$ la ${ }^{\text {III }}$ moon $n$
［OB］la ${ }^{\text {III }}$ © la ${ }^{\text {fil }}$ moon $n$
［OC］ ili＇l $^{\text {il }}$ 夕 ziajk $<*_{\text {s－＇la－k evening } n}$
The comparison is from Sagart（1999b：160）although no account is made for the velar coda．The word is related to $\mathrm{ie}^{\mathrm{III}}$ 夜 $\mathrm{jia}^{\text {III }}<*^{\text {＇lak }}{ }^{\text {III }}$ night $n$ which Takashima（2004：1－5）shows to be sometimes written with the character $\mathrm{i}^{\text {III }}$ 亦 jiajk＜＊＇lak also in the earliest inscriptions．${ }^{144}$ The word 6 iII ${ }^{\text {II }}$ ziajk $<{ }^{\text {s s－＇lak }}$ evening $n$ is attested in the earliest inscriptions as $D$ in contrast to $D$ for ye ${ }^{\text {III }}$月 yuat moon $n$ ，but both forms very soon become interchangeable．${ }^{145}$ The parallelism with the Old Chinese velar suffix in $\boldsymbol{f l}^{\text {III }}$ 日 nit $<*^{\prime} n ə c<*^{\prime}$ nəj＇-k sun，day $n$ under Sun（\＃40）suggests the superfluous $-k$ suffix may be connected with its use as a temporal period associated with its origin as a celestial object．${ }^{146}$

[^56]The necessity to distinguish between $* k r-/ k l$ - and $* k-r-/ k-l$ - concurs well with the observations for Old Chinese in 3.5.2.1 and suggests that bilabial clusters in Inscriptional Burmese which are possibly also reconstructible in Old Chinese, ${ }^{147}$ may be attributed solely to prefixes now lost in Northern Chin rather than to any original clusters. In some cases, what appear to be prefixes may actually be reduced forms of previous syllables:

## [\#5] Finger

[M] *juy (2003:285)
[P\&S] *juy (1996:\#1466)
[NC] ${ }^{*}{ }^{j} \mathrm{~m}^{\mathrm{II}}$ finger, root $n$

Benedict (1972a:76-7), supported in Weidert (1987:184), suggests that the velar coda of the first syllable for hand $n$ has spread over to the initial of the
 (1967b:183-4) as one of the main Burmese classifiers, in this case specifically referring to rod-like objects, would seem to argue against this, yet it is not noted in Ohno's dicussion (2005:277-9) of the main Inscriptional Burmese classifiers which suggests a possible later origin.

### 4.2.1 Velar Clusters with $r$ -

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $* k r_{-}$ | $t_{-}$ | $t^{-}$ | $k-$ | $k-$ | $k-$ | $k-$ |
| $* k^{h} r_{-}$ | $t^{h_{-}}$ | $t^{h_{-}}$ | $x-$ | $x-$ | $x-$ | $k^{h_{-}}$ |

Basing himself on Benedict's development (1972a:41-2) of ideas originally presented by Shafer (1940:309-10), Solnit (1979:117) proposes a similar development of *pr-to $t$ - in Mizo/Zahau and $p$ - elsewhere. Matisoff (2003:405) reconstructs a TibetoBurman root *pral for one of Solnit's examples comparing Mizo thal summer $n$ with

[^57]Tedim $\mathrm{p}^{\mathrm{h}} \mathrm{el}^{\mathrm{III}}$ winter $n .{ }^{148}$ There are several problems with this comparison; the tones are different; the syllable weight is different; the glosses, plausibly connected by Matisoff via a semantic connection of $d r y$ season $n$, are different. ${ }^{149}$ In fact, the Tedim word for summer $n$ is $k^{\mathrm{h}}{ }^{\mathrm{l}}{ }^{1}$, a perfectly regular correlate of the Mizo form. ${ }^{150}$ A more convincing example provided by Solnit is Mizo $t^{\mathrm{h}^{\text {IIII }}}{ }^{\text {good }} v i$ and Tedim $\mathrm{p}^{\mathrm{h}} \mathrm{a}^{111}$ good $v i$ to which Zahau $t^{\mathrm{h}} \mathrm{Im}^{\mathrm{I}}$ needle $n$ and $\mathrm{Zo} /$ Tedim $\mathrm{p}^{\mathrm{h}} \mathrm{m}^{\mathrm{I}}$ needle $n$ may be added. It is probably no coincidence that it is precisely these same two words which Löffler (2002a:133) finds to be irregular in the Southern Chin language Maraa. In the case of the latter, the other three languages, including Mizo, have borrowed the English word pin $n$ which may have subsequently affected the articulation of the native word in Zo and Tedim. In the case of the former, Ohno (1965:16) also treats it as irregular but makes no comment on its source; ${ }^{151}$ it is also significant that the inflected forms, Mizo $t^{\mathrm{h}} \mathrm{et}$ and Tedim $\mathrm{p}^{\mathrm{h}} \mathfrak{e t}$, are irregular as a velar $-k$ would be expected. Further evidence that the original clusters were uniquely velar in origin may perhaps be found in the lack of a voiced retroflex $q$ - in Mizo and Zahau to correlate with $t$ - and $t^{h-}$-. ${ }^{152}$ The devoicing of $g$ - to $k$-, discussed previously, can easily account for this, but if $b r$ - was

[^58]also a legitimate combination then a separate account for the loss of voicing needs to be made. ${ }^{153}$ On this basis the following correspondences may be proposed:

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| ${ }^{* k r-}$ | $k r_{-}$ | $k^{h} r_{-} / k r_{-}$ | $k r_{-} / g r_{-}$ |
| ${ }^{*} k^{h} r_{-}$ | $k^{h} r_{-}$ | $k^{h} r_{-}$ | $k^{h} r_{-} / k r_{-}$ |

## [\#6] Dove

[M] *k(r)əw (2003:125;199)
[P\&S] *gru (1996:\#2032)
[ NC$]{ }^{*}{ }^{\mathrm{h}}{ }^{\mathrm{r}}{ }^{\mathrm{I}}$ dove $n$
[OB] $\mathrm{k}^{\mathrm{h}} \mathrm{ov}^{\mathrm{I}} \S / \$ \delta \mathrm{k}^{\mathrm{h}} \mathrm{iw}^{\mathrm{I}}$ doven

Both forms are attested in the inscriptions, and Luce (1981:27) treats them as variants:
m6unocuospi (WK 3.42)
kabota birth ${ }^{154}$ dove
Kapota birth: dove. ${ }^{155}$
నర్త్రీంఠంయీయం (SIP 43.30)
dove ${ }^{156}$ shoot field 50
Fifty dove shooting-grounds.
Matisoff (1969:168) suggests the vacillation of medial $-r$ - may be due to onomatopoeia. The curious tone II contour in the form retaining the medial
 which Matisoff (1969:194-5) notes to be phonologically very similar. ${ }^{157}$

[^59]
Schuessler (2007:320) notes an aspirated initial in some southern varieties of Chinese.

## [\#7] Weep

[M] *krap (2003:336;339)
[P\&S] * ${ }^{\text {h }}$ rəp (1996:\#2336)
[NC] *krep weep vi
[OC] $16^{\mathrm{h}} \mathrm{i}^{\text {III }}$ 泣 $\mathrm{k}^{\mathrm{h}} \mathrm{ip}<*^{\prime} \mathrm{k}^{\mathrm{h}}$ rop weep $v i$
The aspiration is irregular; Schuessler (2007:423) suggests it may have an onomatopoeic association with an exhaling or outward gesture.

### 4.2.2 Velar Clusters with 1 -

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $* k l_{-}$ | $t^{t_{-}}$ | $t_{-}^{h_{-}}$ | $h_{-}$ | $t-$ | $t-$ | $t-$ |
| $* k^{h_{-}} l_{-}$ | $t^{h_{-}}$ | $t^{h_{-}}$ | $h_{-}$ | $h_{-} / h_{-}$ | $x-$ | $t_{-}^{h_{-}}$ |

Solnit (1979:118) extends his comparison of the clusters with $r$ to suggest that Mizo $t^{l}$-, corresponding to Tedim $t$-, may also reflect Tedim $p$ - from orginal $p l$ - clusters. Of his two examples, the latter, as a specific avian name, is not included in the data-set but from Solnit's transcriptions both the tone and the initial voicing appear to be discrepant. The former is a comparison of Mizo $\mathrm{t}^{1 \mathrm{III}} \sim \mathrm{t}^{\mathrm{t}} \mathrm{k}^{\mathrm{IIb}}$ fall $v i$ and Tedim puk ${ }^{\mathrm{II}} \sim$ puk ${ }^{\text {III }}$ fall $v i$ along with their aspirated causative derivations $\mathrm{t}^{\text {Il }} \mathrm{u}^{\text {III }} \sim \mathrm{t}^{\text {th }} \mathrm{uk} \mathrm{k}^{\text {IIb }}$ fell $v t$ and $\mathrm{p}^{\mathrm{h}} \mathrm{uk}^{\text {II }} \sim \mathrm{p}^{\mathrm{h}} \mathrm{uk}^{\text {lil }}$ fell v . The lack of velar coda in the Mizo form 1 already makes this suspect but the otherwise good phonological and semantic association seems to merit consideration. Nevertheless there are two invalidating pieces of evidence: Thado, which unlike the other languages that fall into the Mizo or Tedim camps respectively, straddles both with ${ }^{\text {h }}{ }^{\text {IIII }}$ fall $v i$ reflecting the $k l$-cluster and $\mathrm{p}^{\mathrm{h}} \mathrm{u}^{\text {li }}$ fell $v t$ reflecting the $p^{h}$ - initial; ${ }^{158}$ the Zo form is $\mathrm{p}^{\mathrm{h}} \mathbf{0 a ^ { I I }}$ whose final $a$ must reflect an original $-r$ not $-k .{ }^{159}$

[^60]The discussion under Fall (\#8) and 7.5.2.2 shows Mizo $\mathrm{t}^{1} \mathrm{u}^{\text {II }} \sim \mathrm{t}^{1} \mathrm{uk}^{\mathrm{IIb}}$ fall $v i$ to be simply an ablaut variant of $\mathrm{t}^{\mathrm{l}} \mathrm{a}^{\mathrm{II}} \sim \mathrm{t}^{\mathrm{l}} \mathrm{ak}^{\mathrm{IIb}}$ drop $v i$ with secondary semantic specialisation.

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $* k l-$ | $k l-$ | $k^{h} l-/ k l-$ | $k l-/ g l-$ |
| $* k^{h} l-$ | $k^{h} l-$ | $k^{h} l-$ | $k^{h} l-/ k l-$ |

## [\#8] Fall

[M] *gla-k $\not{ }^{*}$ kla-k (2003:480)
[P\&S] *kla (1996:\#2189)
[ NC$] \quad{ }^{*} \mathrm{kla}^{\mathrm{nl}(\mathrm{IIII})} d r o p v i$
$*^{\mathrm{k}^{\mathrm{h}}}{ }^{\mathrm{I}}{ }^{\mathrm{n}(/ \mathrm{Im})} d r o p v t$
The tonal variation is suggestive of the Mon-Khmer influence, to be discussed below, which may also have influenced the ablaut variants *klu ${ }^{\text {II }}$ fall $v i$ and *k ${ }^{\mathrm{h}} \mathrm{lu}^{\text {II }}$ fell $v t$ attested in Mizo and Zahau. Matisoff's velar final accounting for Mizo $t^{(h) l} \mathrm{ak}^{\mathrm{Ib}}\left(<{ }^{*} \mathrm{k}^{(\mathrm{h})} \mathrm{a}^{\mathrm{II}}-\mathrm{s}\right)$ represents a regular form 2 derviation via an $-s$ suffix from form $1 .{ }^{160}$
[OB] $\operatorname{tfa}^{\text {III }}$ か/ $/$ K kla ${ }^{\text {III }}$ fall $v i$

Sagart (2006a:214-5) includes these Burmese forms under a Sino-Tibetan root *kra which he attempts to disambiguate from a separate root *glak under which he includes the Mizo form $2{ }^{\text {t }}$ lak ${ }^{\text {IIb }}$. The Mizo evidence was discounted above and the Burmese evidence is contradicted by a medial $-l$ - in the inscriptions:

poison all ${ }^{161}$ surpass ${ }^{162}$ also fall REM REAL body also turns ${ }^{163}$ REAL

[^61]All the poison falls and the body also turns．${ }^{164}$
［OC］lus ${ }^{\mathrm{III}}$ 落 $\mathrm{lak}<* \mathrm{k}$－lak drop，fall vi
Sagart＇s suggestion（2008：154）that by reconstructing＊glak an account for a suffixal－$k$ does not need to be made is mitigated by the removal of the Mizo etymon to leave 落 as the only exponent．${ }^{165}$ Schuessler（2007：371）notes a clear Mon－Khmer association and several alternative roots in Shorto （2006：521－2；524；527）without velar codas suggest this may perhaps be extended to Old Burmese and Northern Chin．The loan direction is unclear and it is likely that there was mutual influence between both language families． The fluctuation of medial $-l$－and $-r$－in the Mon－Khmer forms parallels a possible association with $6 \mathrm{ia}^{\text {III }}$ 下 $\mathrm{ya}^{\mathrm{II} /{ }^{1 / I I}}<\operatorname{gra}^{\text {II／III }}$ descend，below $v i$ which Sagart（2006a：215）includes under his root ${ }^{*}$ kra．${ }^{166}$

## 4．3 Rhotics

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $*_{r_{-}}$ | $r_{-}$ | $r_{-}$ | $g_{-}$ | $g_{-}$ | $g_{-}$ | $y_{-}$ |
| ${ }^{4} r_{-}$ | $h_{r_{-}}$ | $h_{r_{-}}$ | $h_{-}$ | $h_{-}$ | $h_{-}$ | $h_{-}$ |

Luce（1962a：52，1985：I．81－2）and Peterson（2000：81－5）note that in several Southern Chin dialects reflexes of ${ }^{*} r$－have a uvular or velar－fricative articulation．This supports Solnit＇s suggestion（1979：115－6）that its derivation to $g$－or $\eta$－in the most Northern dialects may be due to a shift of $r$－to a velar continuant articulation or due to an original Tibeto－Burman velar allophone；${ }^{167}$ Matisoff＇s association（1969：172）of Written Burmese $r$－with Lahu $\gamma$－provides further support for such a change．${ }^{168}$

[^62]| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $*\left({ }^{(1)} r_{-}\right.$ | ${ }_{(l)} r_{-}$ | ${ }_{(l)}^{r_{-}}$ |  |

## [\#9] Wither

[M] *raw (2003:225)
[P\&S] *ri:w (1996:\#714)
[ NC ] *raw' darken (as leafffruit) $v i$
Peiros \& Starostin also note Matisoff's comparison of Mizo row $d r y v i$ but the rhymes do not correspond and the semantic link is less good.
[OB] $\mathrm{jo}^{1}$ فণ์ raw ${ }^{1}$ wither, over-ripe vi

## [\#10] Alive, Green

[M] $*_{s-r}(\mathrm{j}) \mathrm{ay} æ{ }^{\mathrm{s}}$ s-riy $(2003: 307 ; 506)$
[P\&S] *ts ${ }^{\text {h }}$ rey (1996:\#1257); * ${ }^{\text {h }}{ }^{\text {he: }} \boldsymbol{y}$ (1996:\#2721)
[ NC$]{ }^{* h}{ }^{\mathrm{h}} \mathrm{rg}^{\mathrm{T}}$ green vi, beget $v t$
[OB] $\int_{1}^{1} \mathfrak{g c t}^{\mathcal{E}}{ }^{\text {ray }}{ }^{\mathrm{r}}$ alive vi
There is no evidence for a palatal coda in the inscriptions:

Buddha ${ }^{169}$ future also alive come REAL
The Bodhisattva also comes to life. ${ }^{170}$
In an attempt to avoid the necessity of positing allofamic variation, Benedict (1972a:85) suggests that the Burmese vocalism is perhaps conditioned by the
the compound noun is contingent on the preceding syllable $\mathrm{mi}^{\mathrm{II}}$ \& $\mathrm{mi}^{\mathrm{If}}$ fire $n$ to which the final syllable paũ̃ ${ }^{\text {I }}$ colc: piwg ${ }^{\text {II }}$ arched cover $n$ has been further added. Peiros \& Starostin's proposal (1996:\#661) to

 nape $n$ with $1 \varepsilon^{1}$ ooß $\operatorname{lan}^{1}$ neck $n$ does not correspond in initial or tone, and Peiros \& Starostin (1996:\#645;1691) reconstruct them under separate roots.
${ }^{169}$ The use of superscript $r$ ๆ for medial $r[$ is common for this word in the Lokahteikpan. The various inscriptional spellings of this word, attested in Written Burmese as यゅp;, are discussed by Duroiselle (1919:26-7) who notes a Sanskrit origin which is supported by Luce (1985:II.66).
${ }^{170}$ Based on an original translation by Ba Shin (1962:127).
initial cluster but his evidence is wanting．${ }^{171}$ There are cases in the inscriptions of the word being preceded by an apparently prefixal $r$－Ø－as વO̧C rhray but the $r$ probably represents an original $\partial$－$ァ-$ that has assimilated to the
 alive $v i$ in the following inscription，his earlier gloss（1969－70：II．38）of the

This many ${ }^{173}$ ATTR SUBJ Buddha alive for EMPH ${ }^{174}$
These many（offerings）are for the Lord Buddha．${ }^{175}$
Yanson（2002b：164）believes $\partial \int_{1}^{1}$ วəŋ工 $\partial^{\mathrm{h}} \mathrm{ra} \mathrm{\eta}^{\mathrm{L}}$ lord $n$ to be of Pali origin；it is often found in the inscriptions as ъəय｜ई $\begin{gathered}\text { esjan which is shown by Nishi }\end{gathered}$ （1974：19）to be a variant spelling．${ }^{176}$ It is plausible that confusion with this word caused the loss of the original palatal coda in alive vi．
 t6 ${ }^{\mathrm{L}} \mathrm{Iy}^{\mathrm{I}}$ 青 $\mathrm{ts}^{\mathrm{h}} \varepsilon \mathrm{jng}^{\mathrm{I}}<{ }^{*} \mathrm{~s}^{\mathrm{H}}{ }^{\mathrm{l}} \mathrm{ran}^{\mathrm{I}}$ green，blue $v i$

The development of $s$－prefixed rhotics follow Sagart＇s revisions（1999b：69）of the proposals in Baxter（1983，1992：205－6）．

## ［\＃11］Louse

［M］$\quad *_{\mathrm{S}-\mathrm{r}(\mathrm{j}) \mathrm{ik}(2003: 344 ; 347)}$

[^63][P\&S] *srik louse (1996:\#1525)
[ NC ] ${ }^{* h}$ rik louse $n$

### 4.3.1 Confusion of ${ }^{h} r$ - and $r$ -

There are four cases in the word list where Thado, Zo, Tedim and Sizang correspond to Mizo and Zahau ${ }^{h} r$ - as if it were simply plain $r$-.

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $*^{\prime} r_{-}$ | $h_{-}$ | $h_{r_{-}}$ | $g_{-}$ | $g_{-}$ | $g_{-}$ | $\eta_{-}$ |

Luce (1962a:50) suggests that these velar reflexes reflect original ${ }^{{ }^{h} r \text {-, while the }}$ reflexes in $h$-, discussed in 4.10, reflect a local variant of $h$ - in Mizo and Zahau; statistical evidence belies this proposal. Solnit (1979:116) prefers to distinguish original Tibeto-Burman $*_{s r}$ - from $*_{s-r}$ - to account for the difference but there seems little to warrant this. It seems rather that the rare cases of ${ }^{h} r$-patterning as $r$ - in Thado, Zo, Tedim and Sizang simply reflect the instability of aspiration before sonorants in Mizo and Zahau as discussed in 1.5. A good comparative set is the following:

## [\#12] Creeper

[M] *s-rwi(j) (2003:218)
[P\&S] *ruj (1996:\#835;837)
[NC] *h rojil rope, creeper $n$
The Xôngsai data in Luce (1962c:3, 1985:II.82) suggests an original -l coda. ${ }^{177}$
[OB] jwer ${ }^{11}$ 6g: / qus rwij ${ }^{11}$ creeper $n^{178}$
[OC] leii ${ }^{\text {閫 }}$ lwi ${ }^{\text {II }}<*^{\prime}$ rwal ${ }^{\text {II }}$ creeper $n$

[^64]
### 4.4. Laterals

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ${ }^{l} l-$ | $l-$ | $l-$ | $l-$ | $l-$ | $l-$ | $l-$ |
| $*^{h} l-$ | $h_{l}$ | $h_{l-}$ | $l-$ | $l-$ | $l-$ | $l-$ |

These are attested regularly in Old Burmese and Old Chinese:

| $S T$ | $N C$ | $O B$ | $O C$ |
| :--- | :--- | :--- | :--- |
| *(h) $l-$ | ${ }^{(l)} l-$ | ${ }_{l} l_{-}$ | $(h) l_{-}$ |

## [\#13] Lick

[M] *ljak (2003:81;323;327-8)
[P\&S] *lak (1996:\#1926)
[NC] *liak ${ }^{11}$ lick $v t$
[OB] lje? व్యీ ljak lick vt
Nishi's observation (1977:10-11) that some of the Lolo-Burmese correlates here differ in their rhymes from those corresponding to mj६? ब̂लీ mjak eye $n$
 issues involving the coda in Old Chinese. Alternatively, the Austronesian link in Sagart (2005:163), which is extended to the Chinese comparanda below, suggests external influence may have played a role.

The reconstruction follows Baxter's proposal (1992:182) that a velar coda would be lost before suffixal - ? corresponding to tone II. ${ }^{180}$ Strong evidence

[^65]for an original velar coda in this word stems from the data for the Fuzhou dialect of Min Chinese in Bauer (1988:150) where the $-k$ is still retained.

## [\#14] Road

[M] *lam (2003:250)
[P\&S] *lam (1996:\#1706)
[NC] *lem ${ }^{\text {II }}$ roadn
[OB] lã̃ ${ }^{\text {II }}$ ©̂: $\operatorname{lam}^{\text {II }}$ road $n$
Possibly also related is ${ }^{\text {h }} \tilde{a}^{\text {II }}$ o̧§: "lam ${ }^{\text {" }}$ reach out, stride vt.

### 4.5 Affricates

### 4.5.1 Unaspirated

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $*_{t s-}$ | $t s-$ | $t s-$ | $t f_{-}$ | $t-$ | $t-$ | $t-$ |
| $*_{t} z_{-}$ | $f-$ | $f-$ | $t-$ | $t-$ | $t-$ | $t-$ |

Benedict (1972a:18) proposes deriving Mizo $f$ - from Tibeto-Burman ${ }^{*} \not \subset-$; ${ }^{181}$ this is accepted by Löffler (2002a:128-9) and corresponds well with a similar proposal for a voiced provenance by Peiros \& Starostin (1996:IV.iii). ${ }^{182}$ The change this entails is not too dismilar from the fronting of $\theta$ - to $f$ - in Cockney English; the loss of voicing, paralleling the change of $g$ - to $k$ - discussed above, is readily accounted for by Ohala's observation (1983:201-2) that fricatives have an even greater tendency to become voiceless than stops. Benedict's proposal (1972a:18) to treat Tibeto-Burman *ts- as a

[^66]source of Mizo $s$－is not confirmed by the data here ${ }^{183}$ where it is attested unchanged as ts－in Mizo．${ }^{184}$

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $*_{c-}$ | $t s-$ | $c^{h}-/ c-$ | $c-/ f_{-}$ |
| $*_{j-}$ | $d_{z-}$ | $c_{-}$ | j |

## ［\＃15］Break

［M］＊tcat（2003：330；334）
［P\＆S］＊ R $^{\mathrm{h}} \mathrm{Vt}$（1996：\＃1672）；＊t6Vt（1996：\＃1361）
［NC］＊tset snap（as rope）vi
［OB］ $\mathrm{s}^{\mathrm{h}}$ ？ ºo $\mathrm{c}^{\mathrm{h}}$ at brittle $v i$
［OC］
Matisoff＇s comparison of tss ${ }^{\text {ib }}$ 折 triat＜＊＇tat bend，break $v t$ ，which has an
 initials do not correspond．${ }^{185}$
［\＃16］Suck
［M］＊дjup $x^{*}$ do：p（2003：382）
［P\＆S］＊\＆${ }^{\text {h }} \mathrm{jV}: p$（1996：\＃1670）
［NC］＊＊op ${ }^{\text {II }}$ suck $v t^{186}$
The Burmese evidence below suggests a possible relationship with＊tsoap ${ }^{11}$ lungs $n$ which Matisoff（1978：113－9）derives from an original Tibeto－Burman ＊tsi－wap in which the first part means lung $n$ and the second soft vi．The

[^67]Burmese vocalism implies Sino-Tibetan -wap rather than -wap which suggests the reduction to a monosyllable may have happened earlier there than in Northern Chin which was able to undergo the regular lowering of a to $a$ without undergoing rounding triggered by a medial $-w-$; this concomitantly makes the tentative assumption that the secondary rounding of wap to $o p$ in Northern Chin, as discussed in 5.2.1.3, happened prior to the fusion of the two syllables there.
[OB] soo $2 \phi \delta$ cwip suck vt
Matisoff (1972a:43) cites a variant spelling soo? poo cwit which he originally treats as an irregular derivation but later (2003:382) uses as the basis for an
 variant spelling $\partial s^{\text {h }}$ ov? $æ ə จ \delta \partial c^{\text {h }}$ wip in Stewart \& Dunn (1940-81:104) which in light of the above most likely represents the original. Unfortunately no inscriptional evidence has been found for either but possible Austronesian and Tai-Kadai links with a $-t$ coda are noted by Benedict (1976c:93).

## [\#17] Erect

[M] *tsjuk (2003:357)
[P\&S] *dz ${ }^{\mathrm{h} i \mathrm{i}:(\mathrm{k})}$ (1996:\#1656); *tsuk (1996:\#1180); *tsj(r)ik (1996:\#1329)
[NC] *dzok erect vi
Matisoff's and Peiros \& Starostin's compare ${ }^{*}{ }^{\mathrm{h}}{ }^{\mathrm{h}} \mathrm{vk}$ descend $v i$ with the former Burmese form but the initials do not concur.
[OB] sav? cons cwik steep vi
$\mathrm{s}^{\mathrm{h}} \mathrm{av}$ ใ ๘oวnก $\mathrm{c}^{\mathrm{h}}$ wik build, erect $v t$
Matisoff's comparison of sai $\uparrow \AA \Phi_{\text {© }}$ cik plant $v t$ is rejected in 2.1.1.

Another good example is Matisoff's reconstruction (1985a:8) of Lolo-Burmese *?-
 Peiros \& Starostin (1996:\#1650) compare Mizo fan ${ }^{1}$ stretch vi/t.

### 4.5.2 Aspirated

| NC | Mi | Za | Th | Zo | Te | Si |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ${ }^{*} t^{h}$ - | ts ${ }^{\text {h }}$ | $s$ - | $s$ - | $s$ - | $s$ - | $s$ - |

Benedict's proposal (1972a:17) that Mizo ts ${ }^{h}$ - derives from Sino-Tibetan $* t^{h}-,{ }^{187}$ rather than $c^{h}$-, is supported here.

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $*_{t}{ }^{h}-$ | $t^{h}$ | $t^{h}-$ | $t^{h}-1 t-$ |

[\#18] Emerge
[M] *s-twak (2003:321)
[P\&S] *duak (1996:\#464)
[NC] ${ }^{*}{ }^{\text {h }}{ }^{\text {roak }}{ }^{\mathrm{HI}}$ emerge $v i$

[\#19] Vagina
[M] *s-tu (2003:247)

[NC] *tshu vagina $n$
[OB] -
Benedict (1972a:53) suggests a possible association with sav? como cwik vulva but the initial and coda are discrepant; Peiros \& Starostin miscite it without the $-k$ coda. ${ }^{188}$

[^68]
## 4．6．Sibilant $s$－

## 4．6．1 Affricate Source

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $*_{s-}$ | $s^{-}$ | $s^{-}$ | $s_{-}$ | $s^{-}$ | $s_{-}$ | $s_{-}$ |

The fate of Sino－Tibetan $* k^{h i}$－appears to be Northern Chin $s$－：

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $* k^{h j_{-}}$ | $s-$ | $c^{h}-$ | $c^{h}-c_{-}$ |

## ［\＃20］Wash

［M］＊s（j）il（2003：425；508）
［P\＆S］＊siə：l（1996：\＃1567）
［NC］＊sIl ${ }^{1 \mathrm{II}}$ wash $v t$

This comparison is from Löffler（1966：134）who associates the Mizo form．

The evidence for a root initial $c^{h}$－stems from the relationship of $61^{1}$ 西 $s \varepsilon j^{1}$ west $n$ ，as a depiction of a bird＇s nest $\#$ in the earliest inscriptions，${ }^{190}$ with the homophonous character $6 i^{1}$ 棲 $\operatorname{sej}^{\mathrm{j}}$ nest $n$ ，roost vi whose phonetic is t6 ${ }^{\mathrm{h}} \mathrm{i}^{\mathrm{i}}$ 妻 $\operatorname{ts}^{\mathrm{h}} \varepsilon \mathrm{j}^{\mathrm{l}}<{ }^{*} \mathrm{c}^{\mathrm{h}} \mathrm{\partial l}^{\mathrm{l}}$ consort，wife $n$ ．Pulleyblank＇s proposal（1962：132；215－6， 2001：48）to reconstruct 6i ${ }^{\text {I 西 }} \mathrm{sej}^{\mathrm{j}}$ with ${ }^{*} s-n$－due to it appearing to be phonetic in naj ${ }^{11}$ 逎 $n ə j^{\prime \prime}<{ }^{\prime \prime} n^{\text {il }}$ is plausible in light of $*_{s-}{ }^{h} n$－also giving Middle Chinese $s$－in the system here，but suffers from the rhymes not corresponding．${ }^{191}$ However Sagart（2004：72）observes there to be no other obvious explanation for the use of such a phonetic and suggests that the root initial of 洗 was ${ }^{S}$－ and the character 酒 was only used interchangeably with 洗 after the shift of

[^69]$*_{S}{ }^{h} n$ - to $s$ - had occurred. Unfortunately Sagart's proposal disqualifies the Old Burmese comparandum; further research is required although possibly of note is Mizo sıg ${ }^{\text {IIa }}$ ten-thousand $n$ as plausable loan from Chinese $t_{6}{ }^{\text {hi }}$ inn $^{\mathrm{I}} \not$ fs $^{\mathrm{h}} \varepsilon \mathrm{g}^{\mathrm{I}}<$ *s- ${ }^{\text {h }}{ }^{n}{ }^{1}{ }^{\mathrm{I}}$ thousand $n$.

## [\#21] Hot

[M] *tsa-t (2003:462-4)
[P\&S] *ts ${ }^{\text {ha (1996:\#1189) }}$
[NC] *sa hot $v i$
Matisoff's - $t$ suffix that accounts for Mizo set ( $<*^{1} \mathrm{sa}^{1}-\mathrm{s}$ ) represents a regular form 2 derviation via an $-s$ suffix from form 1 .
[OB] $\mathrm{s}^{\mathrm{h}} \mathrm{a}^{\mathrm{I}} ฆ \infty \mathrm{c}^{\mathrm{h}} \mathrm{a}^{\mathrm{I}}$ hungry $v i$
See the other comparanda in Benedict (1972a:27) for the semantic link.

### 4.6.2 Benedict's *sj- Hypothesis

Benedict (1972a:53) proposes another source of Northern Chin $s$ - to be TibetoBurman ${ }_{s j j}$ - In the development of Northern Chin vocalism adopted here this would assume the fronting of $a$ and $a$ to $I / i$ and $\varepsilon / e$ in all cases but Benedict's proposal is primarily based around the following correspondence set with $a$ whose Lolo-Burmese reconstruction is less than certain: ${ }^{192}$

## [\#22] Meat

[M] *sja (2003:448)
[P\&S] *sja (1996:\#1543)
[NC] *sa ${ }^{11}$ meat $n$
[OB] $\theta \mathrm{a}^{\mathrm{II}}$ دک: sa ${ }^{\mathrm{II}}$ meat $n$

[^70]Bradley (1979:152) adds an extra Lolo-Burmese initial phoneme * $x$ - to Matisoff's (1972a:55-6) $*_{s-}$ and ${ }^{*} 6-(s j-)$ to account for cases in Lisu where $\kappa$ or $x$ - correspond to sibilants elsewhere. This leads him (1979:306) to reconstruct Lolo-Burmese *xa ${ }^{\text {II }}$ meat $n$ which is supported by Benedict (1975:291). Bradley explicitly notes (1979:152) that this initial phoneme should not be reconstructed back to Tibeto-Burman but makes no account for how it could then have emerged. It is plausible that this is a case of original Lolo-Burmese ${ }^{*} h$-, which is noted in 4.10 .2 to be rare, followed by a medial glide, but without further evidence little more can be proposed.

Although it could be proposed that $-j$ - may have merged with $s$ - before vowel fronting occurred in Northern Chin to give 6 - which remained distinctive enough from ${ }^{*}$ - to prevent it from occluding to $t^{h}$-, this causes difficulties for cases of coda palatalisation in Old Chinese triggered by medial $-j$ - in words like Tree (\#84). It may be noted that loanwords are a further source of Northern Chin $s$ - as shown in 6.5.4.

### 4.7 Dentals

| $N C$ | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ${ }^{*}$ t- | $t$ - | $t$ - | $t$ - | $t$ - | $t$ - | $t$ - |
| $*_{t}{ }^{\text {b }}$ - | $t^{h}$ - | $t^{h}$ - | $t^{h}$ - | $t^{h}$ - | $t^{\prime \prime}$ | $t^{\prime \prime}$ |
| * $d$ - | $d-$ | $d$ - | $d-$ | $d$ | d- | d- |
| ${ }^{*}{ }^{\prime}$ - | $n$ - | $n-$ | $n$ - | $n$ - | $n$ - | $n$ - |
| ${ }^{* /} n$ - | ${ }^{n}{ }_{n}$ | ${ }^{n} n$ - | $n-$ | $n$ - | $n-$ | $n-$ |

### 4.7.1 Unshifted

Except for Northern Chin $t^{h}$ - the dentals are mostly reflected unchanged from SinoTibetan:

| ST | NC | OB | OC |
| :---: | :---: | :---: | :---: |
| $*_{t}$ - | $t$ - | $t^{\prime \prime}-1 t-$ | $t-/ d-$ |
| * d- | $d$ | $t$ - | $d$ - |
| * ${ }^{(h)}{ }_{n}$ - | ${ }^{(h)} n$ - | ${ }^{(l)} n$ - | ${ }^{(k)} n$ - |

## [\#23] Stand

[M] *dig (2003:307)
[P\&S] *d ${ }^{\mathrm{l}} \mathrm{e}: \mathrm{y}(1996: \# 473)$; *[t]en (1996:\#867)
［NC］${ }^{*} \operatorname{diy}^{1}$ stand $v$
［OB］tモ ${ }^{\mathrm{I}} \omega \mathfrak{\bigcup} \tan ^{\mathrm{I}}$ establish vi／t
［OC］ $\mathrm{t}^{\text {h }} 19^{\text {lb }}$ 亭 $\mathrm{d} k j \mathrm{~g}^{\mathrm{I}}<*$ dan $^{\mathrm{I}}$ settle，regulate $v t$
tig ${ }^{\text {III }}$ 定 $\mathrm{d} \varepsilon \mathrm{jg}^{\text {III }}<$＊dan ${ }^{\text {III }}$ establish vi／t
［\＃24］Length
［M］＊duy（2003：285－6）；＊duy $x^{*}$ tu：$(2003: 288)$
［P\＆S］＊toy（1996：\＃955）；＊dhug（1996：\＃509）；＊t ${ }^{\text {（h）}}$ uy（1996：\＃1083）
［NC］＊doy length n
＊tog ${ }^{\text {I }}$ warp $n$ ，erect $v i / t$
The voiced initial in Zahau doy ${ }^{\text {III }}$ cubit $n$ ，which corresponds to toy ${ }^{\text {III }}$ elsewhere， suggests the Northern Chin word to be a Burmese loan；this accounts for the curious vocalism．
［OB］taõ̃ $\cos ^{\mathcal{E}} \mathrm{t}^{\mathrm{t}} \mathrm{win}^{\mathrm{I}}$ cubit，wing $n^{193}$

## ［\＃25］Hurt，ill

［M］$\quad{ }^{n}$ na－n／t（2003：440）
［P\＆S］＊nə：（1996：\＃519）
［NC］＊na hurt，ill vi
Matisoff＇s $-t$ suffix accounting for Mizo net（ $<{ }^{*}{ }^{\mathrm{n}}{ }^{\mathrm{I}}$－s）represents a regular form 2 derviation via an $-s$ suffix from form 1 ．
［OB］na $\$ \supset$ na ${ }^{\mathrm{I}}$ hurt，ill vi

[^71]Matisoff compares na？§o乏 nat spirit $n$ but the derivation of final $-t$ in Northern Chin from $-s$ makes this unlikely．
［OC］
Notwithstanding semantic issues，Matisoff＇s and Peiros \＆Starostin＇s comparison of nan ${ }^{18 / I I}$ 難 nan $^{1 / / I I}$ difficult vi，difficulty $n$ is unlikely because following the discussion in 3．2．1 and 5．2．4．1 it would originally have had an $-r$ coda which would have been retained in Northern Chin．

## 4．7．2．Sibilant in Origin

The origin of Northern Chin $t s^{h}$－in Sino－Tibetan $*_{t} t^{h}$－suggests an alternative source for Northern Chin $t^{h}$－which Benedict（1972a：17）suggests may be found in＊s．This gives the following correspondences：

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $\boldsymbol{*}_{s-}$ | $t^{h}-$ | $s-$ | $s-$ |

［\＃26］Kill
［M］＊sat（2003：330；335）
［P\＆S］＊sa：t（1996：\＃1495）
［NC］＊t ${ }^{\text {b }}$ et kill $v t$
［OB］Өa？つుoీ sat kill vt
［OC］sa ${ }^{1}$ 殺 s ait $<{ }^{*} \mathrm{r}$－sat kill $v t^{194}$
［\＃27］Itch，breath
［M］＊sak（2003：317）；＊sak（ibid：317；326）
［P\＆S］＊sak（1996：\＃1488）；＊sək（ibid：\＃1489）

[^72][NC] *t ${ }^{\mathrm{h}} \mathrm{ek}$ itch, spicy vi
[OB] $\Theta \varepsilon$ ? $ు$ กీ sak slightly bitter vi; breath, life n
The Burmese form glosses bridge the semantic gulf between Northern Chin and Old Chinese. Although these could be accidental homophones in Burmese, a possible association may be established from compounds like
 voice $n$ in which the former syllables seem to carry the semantic weight ${ }^{195}$ and the latter syllable could plausibly be associated with either gloss.
[OC] 6il ${ }^{\text {息 }}$ sik < *'sok breathe $v i$
[\#28] Rot
[M] *zu(w) (2003:227)
[P\&S] *so ※sew (1996:\#1515)
[NC] *thur rot $v i$
The association of $t^{\text {h}} u^{\text {III }}$ (<*thus) rotten discharge $n$ is discussed in 7.3.

### 4.8 Glides

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $*_{w-}$ | $v_{-}$ | $v_{-}$ | $v_{-}$ | $v_{-}$ | $v_{-}$ | $v_{-}$ |
| $*_{j-}$ | $z-$ | $z-$ | $j_{-}$ | $z-$ | $z-$ | $z_{-}$ |

### 4.8.1 Labiovelar $W$ -

The provenance of Northern Chin $v$ - as a labiovelar glide $w$ - is well-supported: Benedict (1972a:18), relying on missionary orthographies, transcribes the Mizo reflex as $w$-; Luce records $w$ - for some Southern Chin languages (1962a:55) and transcribes $v^{w}$ - in Xôngsai (1962c; 1985:II.70-87). As with the shift of ${ }^{*} r$ - to $g$ - in the more Northern Chin languages that was possibly favoured by the loss of voicing of original

[^73]${ }^{*} g$ - to $k$-, the shift of ${ }^{*} w$ - to $v$ - was perhaps favoured by the devoicing of $f$ - in Mizo and Zahau that again diffused north like the shift of $*_{j}$ - to $z$ - to be discussed below. The Sizang reflex of ${ }^{*} w$ - as $h$ - before $u$ perhaps also hints at a previous non-fricated source. Although attested in Old Burmese and Old Chinese, Luce (1962a:51) explcitily notes no evidence for ${ }^{h} w$ - in Northern Chin.

## [\#29] Bear

[M] *wam (2003:252;531)
[P\&S] *? ${ }^{\mathrm{w}}$ әm (1996:2013)
[NC] *wom bear n
This is most likely related to *wom' black vi. Notably the word bear $n$ usually occurs with the animal prefix sa- perhaps literally meaning black animal $n$. The original $\mathfrak{e}$ vowel has undergone secondary rounding to $o$ under the influence of the labial initial; see the discussion in 7.5.2.2.
[OB] wü ${ }^{\text {º }}$ wam $^{\text {I bear } n}$
[OC] 6yon $^{\text {rb }}$ 熊 wuwn ${ }^{1}<*^{\prime}$ wəm ${ }^{1}$ bear $n$

### 4.8.2 Palatal $j$ -

Peterson's observation (2000:94) that $j$ - in some Southern Chin languages corresponds to $z$ - in the Northern ones is supported by the data in Luce (1985.II:7087). Peterson's further suggestion (2000:80) that the shift to $z$-first occurred in lanaguages like Mizo and Zahau and then diffused northwards is supported by the fact that Thado, as the language furthest north, still often retains a post-alveolar articulation. Luce's data (1962a:39) does not support Peterson's proposal (2000:94) for an original ${ }^{h} j$ - in Southern Chin which is not attested in the North. ${ }^{197}$ The dubious

[^74]status of Old Chinese $j$ - is discussed in 3.5.1 and precludes a solid Sino-Tibetan reconstruction:

| $S T$ | $N C$ | $O B$ | $O C$ |
| :--- | :--- | :--- | :--- |
| $* ?-$ | $j-$ | $(n)_{j-}$ | $?$ |

## [\#30] Ashamed

[P\&S] *jak (1996:\#1418); *srok (ibid:\#1522)
[NC] *jek ashamed, humble vi

Peiros \& Starostin keep the Burmese and Northern Chin forms apart due to the Written Burmese ${ }^{h} r$ - initial which Matisoff accounts for with allofams. Only one inscriptional form has been identified and this reflects ${ }^{h} r$-:

not scared not ashamed
Not scared and not ashamed.
However, Stewart \& Dunn (1940-81:324) note a variant Written Burmese
 1988a: 1269) of $*_{j}$ - in Lolo-Burmese as opposed to Bradley's $*_{s-r}$ - (1979:342).
[\#31] Night
[M] $\quad$ *s-ja-n $(2003: 165 ; 329)$
[P\&S] *n-ja (1996:\#1412)
[NC] *jan ${ }^{\text {III }}$ night n
Benedict's derivation (1972a:102) of the $-n$ suffix must be rejected on the basis of the Burmese evidence below for an original $-n$ coda.
[OB] nîil $ల \mathfrak{L}$ /

```
That night Maddī sleep \({ }^{198}\) dream (dream) \({ }^{199}\) REAL
That night Maddī dreams a dream. \({ }^{200}\)
```

Following Thurgood (1981:10) and Luce (1981:3), na ${ }^{\text {III }} \circlearrowright \mathrm{na}^{\text {III }}$ night $n$ may be treated as a reduced variant form. The palatalisation of the coda suggests an original medial $-j$-, but Benedict (1972a:100) and Sagart (1999b:35) believe that $j$ was the root initial and that a nasal prefix caused the distinctive Burmese reflex. Benedict proposes that an $n$ - prefix was derived from from ne ${ }^{1 / 1 / t} 6 \Phi / 6 \phi_{0}$ nəj/IIII sun, day $n$ as the first part of what was originally a compound noun; Sagart proposes that the generic nasal voicing prefix that he assumes caused voicing before obstruents in Old Chinese was retained in Burmese as nasalisation in Chinese loanwords. Like Benedict, Sagart is not aware of the original $-n$ coda in Burmese making his proposal for a Chinese loan origin,
 day n, discussed under Sun (\#40), is supportive of Benedict's hypothesis for a similar night-time compound.
[OC] -
Sagart's proposal (1995a:251) that i $\varepsilon^{\text {III }}$ 夜 jia ${ }^{\text {III }}<*^{\prime}$ lak ${ }^{\text {III }}$ night $n$ should be reconstructed with $* N-l$ - and was loaned into Burmese after the loss of the velar coda makes no account for the $-n$ coda in Burmese. His supporting example (1999b:35) treating ni' $\underbrace{\text { ² }}$ nit younger-brother $n$ as a loan from tili ${ }^{\text {il }}$ 弟 $\mathrm{d} \varepsilon \mathrm{j}^{11}<$ 'l'jj $^{11}$ younger-brother $n$ via an $N$ - prefix may be rejected due to it ignoring the fact that in Inscriptional Burmese the word is often attested with a velar initial as ${ }^{\circ} \mathrm{nit}^{\mathrm{i}}$ which palatalised before the high front vowel $i$ in Written Burmese as discussed in 2.3.1.1: ${ }^{201}$

Buddha ${ }^{202}$ slave ... younger-brother $\mathrm{Nga}^{203} \mathrm{Ku}$

[^75]
### 4.9. Bilabials

## [\#32] Discard

[M] *ba $¥$ *bacj (2003:483-4)
[P\&S] *pa:j (1996:\#179); *Pjol (1996:\#360)
[NC] *paj ${ }^{\text {III }}$ discard $\nu t$
[OB] $\mathrm{p}^{\mathrm{h}} \mathrm{e}^{\mathrm{t}} \mathrm{ovs}^{\mathrm{S}} \mathrm{p}^{\mathrm{h}} \mathrm{aj}^{\mathrm{t}}$ push/set aside $v t$
Okell (1969:208) tentatively suggests there may be an association with $p \varepsilon^{1} \mathcal{o} \delta$ paj ${ }^{\text {I }}$ reject, decline $v t$. The tone I appears to reflect the underived form as opposed to tone III in Northern Chin and Old Chinese.
[OC] po ${ }^{\text {III }}$ 播 $\mathrm{pa}^{\text {III }}<*{ }^{*} \mathrm{pal}^{\text {IIt }}$ sow, disseminate $v t$
Matisoff (2000a:161, 2003:394;425) compares Mizo vor? sow vt but the phonological correspondence is poor. ${ }^{204}$

[^76]
## [\#33] Son-in-law

[M] *s-ma:k (2003:325)
[P\&S] *mark (1996:\#65)
[NC] *mak ${ }^{11}$ son/brother-in-lawn.

Following Matisoff (1972a:61), the first syllable may be treated as an abbreviated form of $\Theta \mathrm{a}^{\mathrm{II}}$ دکః sa $\mathrm{sa}^{\mathrm{II}}$ child $n$; a similar case may be found in the word $\Theta$ əmi ${ }^{\text {II }} 20$ छి: somi ${ }^{\text {II }}$ daughter $n$ discussed in 6.5.3.

## [\#34] Ripe

[M] $\quad{ }_{\mathrm{s}-\min }(2003: 277)$
[P\&S] *s-min (1996:\#107)
[ NC$]{ }^{* h} \mathrm{mmn}^{\mathrm{I}}$ ripe $v i$

Tone III is derived from suffixal $-s$ and corresponds to Northern Chin form 2 $*^{\text {h }} \min ^{\text {III }}\left(<{ }^{* h} \mathrm{~min}^{\mathrm{h}}\right.$-s).

### 4.9.2. Lenition to $w$ -

Benedict (1972a:23) notes a sporadic lenition of $p$ - to $w$ - across Sino-Tibetan which he attributes to preceding prefixes. ${ }^{205}$ Benedict's analysis is favored by Sagart (2006a:211-2) who compares it to the spirantisation of voiceless obstruents in Vietnamese after pre-syllables as outlined by Ferlus (1982:87-98). ${ }^{206}$ Later Benedict (1972a:24) proposes the alternative that $w$-simply extruded from an original $p$-; this is favored by Matisoff (2000a:175-82, 2007:438-9) who, concomitantly rejecting his

[^77]own previous proposal（1997b：33）for an unspecified $p$－prefix on a disproportionately large number of words with initial $w$－，rejects Benedict＇s former explanation due to insufficient evidence for such prefixes．${ }^{207}$ A difficulty with the extrusional hypothesis is that by attempting to explain the phenomenon via an intrinsic feature of the syllable， rather than an externally applied prefix that may or may not be present，an account for the irregularity of the lenition process can no longer be made．Unfortunately the Northern Chin evidence does not elucidate the issue any further but a tonologically somewhat problematic case possibly supporting the prefixal hypothesis is found below．${ }^{208}$

## ［\＃35］Bamboo

［M］$\quad *_{r-p}{ }^{w}(2000: 140-1)$
［P\＆S］＊wa：（1996：\＃432）
［NC］＊roa ${ }^{1}$ bamboo $n$
Weidert（1987：135－6）suggests that the tone of the Northern Chin is irregular when compared with Naga evidence reflecting tone II．
［OB］wa ${ }^{\text {II }}$ ol：wa ${ }^{\text {II }}$ bamboo $n$
［OC］ba ${ }^{\text {II }}$ 笆 bai $^{\text {II }}<{ }^{*}$ r－ba ${ }^{\text {II }}$ bamboo $n$
ba $^{1}$ 笆 $\mathrm{pai}^{\mathrm{I}}<{ }^{+} \mathrm{r}$－pa ${ }^{\mathrm{I}}$ bamboo basketffence $n$
The tonal variation between Chin and Burmese is attested here also． Schuessler（2007：152）suggests the former may be a loan from Tibeto－Burman due to its first appearance being in the Guangyun and it also being glossed there as specifically coming from southwest China．

[^78]| $N C$ | Mizo | Zahau | Thado | Zo | Tedim | Sizang |

### 4.10.1 Unshifted ?-

Matisoff (1997b:29;34) suggests that a distinction cannot really be made between a glottalic onset and a zero-initial in Tibeto-Burman. When looking at Northern Chin from a purely synchronic perspective Matisoff's comment is well-founded; the distinct glottalic creak in Zahau may be treated as a default onset without necessarily having any diachronic significance. In Inscriptional/Written Burmese, the
 may simply be a vocalic place-holder, ${ }^{209}$ and on the basis of internal evidence alone there is no way of distinguishing whether a word begins with 1 - followed by a medial $-j^{210}$ or $-w$-, or whether it instead begins with a root initial $j$ - or $w$-. However, the reconstruction of Old Burmese as a two vowel $\dot{i} / a$ system shifts the question regarding glottalic onsets away from a synchronic debate over how syllables beginning with open vowels are articulated to whether or not in diachronic terms an initial glottal can be followed by a glide. Comparisons like Northern Chin *wok pig $n$ and Old Burmese w\&? on wak pig $n$ as opposed to Northern Chin *?op brood vi and Old Burmese wu? of wap brood $v i$ suggest a distinction between initial ${ }^{*} w$ - for the former ${ }^{211}$ and ${ }^{*} ? w$ for the latter. Further evidence for a Sino-Tibetan ?- comes from Pulleyblank's observation (1984a:64) that Late Middle Chinese tonal developments in syllables for which a glottal may be reconstructed reflect a voiceless initial; in spite of Pulleyblank's attempts (1995c:292-6) to demote 2 - to an obligatory onset for vowels

[^79]in Old Chinese, ${ }^{212}$ Baxter's reconstruction (1992:207) of a distinct phoneme is preferable. ${ }^{213}$

## [\#36] Dumb

[M] * $3 \mathrm{a}(2003: 176)$
[P\&S] *r-Pa: (1996:\#1977)
[NC] *?a ${ }^{11}$ foolish $v i$
The tone in Mizo and Zahau is IIa, rather than the expected IIb, ${ }^{214}$ suggesting that onomatopoeia has played a role.
[OB] $\mathrm{a}^{\text {III }}$ ъ $\mathrm{a}^{\text {III }} d u m b v i$
Matisoff (1978b:25) suggests the Burmese tone III to be secondary; this is supported by Bradley's (1979:348) and Matisoff's (1998a:235) reconstruction of Loloish tone II.

Whether Pulleyblank's proposal (1995c:294-6, 1998b:212) for long vowels in Old Chinese is accepted or not, it is unlikely that the Middle Chinese vocalism of this form derived from a cluster involving $-r$ - as Peiros \& Starostin suggest. Schuessler (2007:550) believes onomatopoeia may have played a role which is most likely the casue of the discrepant Northern Chin and Burmese tones.

### 4.10.2 Peiros \& Starostin's Uvular Hypothesis

Benedict (1972a:33, 1988b:20) treats $h$ - as a very marginal phoneme in TibetoBurman; Matisoff (1997) attempts to fill this lacuna but the correspondences are still

[^80]not regular and he prefers $(1997: 32-3,2007: 439)$ to attribute the alternations to proto－ variation．For Lolo－Burmese，Matisoff（1972a）reconstructs no etyma with $h$－and notes（1997b：31）that many of the $h$－initialled forms in Loloish correspond to complex clusters involving resonants in Burmese．${ }^{215}$ Peiros \＆Starostin＇s（1996：V．iii－ iv）reconstruction of a uvular series ${ }^{*} q$－and ${ }^{*} G$ to account for correspondences of Mizo $1-/ h$－with Old Burmese $2-/ k^{h}$－and with Old Chinese velars is queried by Bengtson（1998：170）and strongly repudiated by Benedict（1998：151）on typological grounds．${ }^{216}$ Although Sagart＇s proposal（2007）for uvulars in Old Chinese is provisionally adopted in 3．5．1，Matisoff＇s concerns（2007：439）over the lack of regularity when projecting this back to Sino－Tibetan is evident in Peiros \＆Starostin＇s inability to pin the reflexes down precisely．

Peiros \＆Starostin＇s comparative sets in support of uvulars tend to suffer from a variety of problems：lack of internal Old Chinese evidence for uvulars in cases like
 and t6ien ${ }^{\text {II }}$ 見 k $k n^{\text {III }}<*$ kjan $^{\text {III }}$ see $\nu t$（1996：\＃2537）；a demonstrable loanword origin in cases like Cover in 6．5．4；associations with sound－symbolism，which Matisoff （1997b：33－4）notes to be a common role of laryngeals，in cases like Mizo ham ${ }^{\text {III }}$ yawn $v i$ and $t^{\mathrm{h}} \mathrm{i}^{\mathrm{in}} \mathrm{n}^{\text {III }}$ 欠 $\mathrm{k}^{\mathrm{h}} \mathrm{iam}^{\text {III }}<*^{\prime} \mathrm{k}^{\mathrm{h}} \mathrm{am}^{\text {III }}$ yawn $v i$（1996：\＃2091）or Mizo hak ${ }^{\mathrm{Ib}}$ choke $v i^{217}$ and hel uભ์ hak phlegm vi（1996：\＃2620）．In the particular case of Peiros \＆Starostin＇s comparison of Mizo hiy ${ }^{1}$ sour vi with $\dagger^{\text {thin }}{ }^{1}$ શर $\mathrm{k}^{\mathrm{h}} \mathrm{jan}^{\mathrm{I}}$ sour，acidic vi（1996：\＃2079）， Matisoff（1988a：459）queries why his Lolo－Burmese reconstruction＊${ }^{2}$－kjiy ${ }^{1}$ does not compare with his Lahu data that suggests＊？－kjan．${ }^{1}$ Nishi＇s suggestion（1974：26）that that the discrepancy may be triggered by a medial $-j$－that caused a shift of $-n$ to $-\eta$ is

[^81] variation is suggested by Okell (1971:19) to be associated with the *klj-clusters discussed in 2.3.2.2:

హ్రీస్లొలీయయీ, (IB 164.17)
earth acid paddy-field 400
400 acidic earth paddy-fields.
ఫqum3̊0 గీค
Buddha Dīpangkarā SUBJ fig sour open REAL Dīpangkarā Buddha blossoms at the sour fig-tree. ${ }^{218}$

Another interesting case may be found in the word for $\operatorname{dog} n$ for which Peiros \& Staorstin (1996:\#2951) reconstruct uvular * $q$ - but Matisoff (2003:448-9) reconstructs labiovelar $*^{w}$ - on the basis of his proposals in Lolo-Burmese (1969:196-7) to account for a Lahu bilabial aspirate $p^{h}$ - rather than the expected $k w$-. In spite of Matisoff's uncertainty (2003:24) as to whether his labiovelar proposal can be reconstructed back to the Tibeto-Burman level, and additional problems with the Old Chinese coda, the otherwise regular correspondences suggest it may be a very old loanword:

## [\#37] Dog

[M] *k ${ }^{\mathrm{w}}$ อj-n (2003:448-9)
[P\&S] *q ${ }^{\text {lw }} \mathrm{i} \mathrm{i} \mathrm{j} / \mathrm{n}(1996: \# 2951)$
[NC] *?oj ${ }^{11} \operatorname{dog} n$
Benedict (1972a:26) supposes the initial velar was reanalysed as a prefix and dropped; Peiros \& Starostin account for its lack by reconstructing a uvular initial. The Xôngsai data in Luce (1962c:3; 1985:II.82) suggests an original $-l$ coda.
[OB] $\mathrm{k}^{\mathrm{h}}$ wer $^{\mathrm{II}}$ 68: / $\mathrm{Qu}^{0} \mathrm{k}^{\mathrm{h}} \mathrm{wij}^{\text {il }} \operatorname{dog} n$
Matisoff (1969:196-7) originally suggests the velar initial may derive from the Lolo-Burmese velar animal prefix, discussed in Matisoff (1969:190-9), but later (1980:11) follows Benedict in reconstructing an original velar element that was dropped in Northern Chin. Matisoff (1978b:6-7) attempts to bolster

[^82]the evidence for a Lolo-Burmese labiovelar initial $* k^{w}$ - by adding LoloBurmese ${ }^{*} \mathrm{k}^{\mathrm{w}} \mathrm{j}^{1}$ nest $n$ which also has a bilabial initial in Lahu. However, Matisoff's other supporting examples are problematic: in spite of Burmese $p^{\text {hir }} 1^{11}$ ఆ: / / reconstructs for Lolo-Burmese, Matisoff, in Benedict (1979:27), reconstructs Lolo-Burmese * $2-\mathrm{g}^{\mathrm{w}} \mathrm{yj}^{\mathrm{II}}$ comb $v t^{220}$ to compare a tonologically discrepant Mizo isolate $\mathrm{k}^{\mathrm{h}} \mathrm{vj}$ ? comb $n / v t$; Matisoff (1980:24, 1986:83) ${ }^{221}$ adds ${ }^{\mathrm{y}} \mathrm{y}$ wat star $n$, due to its $m$ - reflex in Lahu but, as noted in Matisoff (1985a:14-5), the rhyme correspondence is not well-supported; Matisoff (1986:84-7) reconstructs *N$\mathrm{g}^{\mathrm{w}} \mathrm{a}^{\text {II }}$ chew $v t$ due to a Lahu bilabial $b$ - reflex but has to insert a medial $-j$ - as * $\mathrm{N}-\mathrm{g}^{\mathrm{w}} \mathrm{ja}^{\text {II }}$ to account for the Lahu rhyme while acknowledging that the basic root is *wa, as reconstructed by Peiros \& Starostin (1996:\#431), with the velar initial emerging through reanalysis of its prefixal origin as a root initial. ${ }^{222}$
[OC] $\mathrm{tc}^{\text {h }} \mathrm{yEn}^{\text {II }}$ 犬 $\mathrm{k}^{\mathrm{h}} \mathrm{wen}^{\text {II }}<*^{\mathrm{h}} \mathrm{k}^{\mathrm{w}} \mathrm{j} \partial \mathrm{n} / \mathrm{l}^{\text {II }} \operatorname{dog} n$
Sagart (1999b:190) rejects Benedict's proposal (1972a:158) for an $-n$ suffix to instead propose a liquid coda but Old Chinese $-n$ would suggest an original *- $r$ while Northern Chin $-j$ would suggest an original *- $l$.

The question regarding the specific role of uvulars, if indeed a reconstructible category, remains very much open. Another suggestive case is the follwing:

## [\#38] Steal

[M] *ru:k (2003:80); *r-kəw (2003:441)
[P\&S] *r-q ${ }^{\text {he: }}$ (1996:\#2568)
[ NC$]{ }^{*} \mathrm{ru}{ }^{\mathrm{II}}$ steal vt

[^83]The final $-k$ in Matisoff＇s former root should be derived from suffixal $-s$ ． Peiros \＆Starostin suppose that an $r$－prefix replaced the original uvular initial after it developed into Northern Chin $\varnothing-/ 2-$ ．Further evidence for a uvular initial may possibly be found in Matisoff＇s reconstruction（1997b：33）of an allofam＊hu．

Matisoff＇s latter form accounts for the Burmese reflex；the $r$－prefix is reconstructed on the basis of Written Tibetan．Weidert（1987：150－1）and Löffler（1966：130）support Peiros \＆Starostin＇s association of the Burmese and Northern Chin forms．
［OC］－
Peiros \＆Starostin compare $\mathrm{k}^{\mathrm{h}} \mathrm{ou}^{\text {II }}$ 寇 $\mathrm{k}^{\mathrm{l}} \mathrm{\partial w}^{\text {III }}<*^{\mathrm{k}} \mathrm{k}^{\mathrm{h}} \mathrm{w}^{\text {III }}$ rob $v$ ，robber n ．The derived nature of tone III suggests it may have ousted another tone but following Yakhontov＇s proposal（1970：65）that wan ${ }^{\text {lb }}$ 完 耳wan $^{\text {I }}<$＊gaw－n $^{1}$ complete $v t$ is phonetic the rhymes are difficult to reconcile．Notably Peiros \＆ Starostin（1984：124）suggest an Austronesian link．

## Chapter 5: Northern Chin Rhymes

On the basis of internal evidence alone, Northern Chin cannot properly be reduced beyond a basic five vowel system. The only sign that something might be amiss is the synchronically moot point that $-j$ and $-w$ cannot occur as codas after $I / i$ and $v / u$ due to the lack of a possible phonetic distinction in Northern Chin between $-i$ and $-i j /-i j$ or $-u$ and $-v w /-u w$. The problem that this entails diachronically is an inherent contradiction whereby, on the distributional grounds that all vowels can occur with all codas, if $-j$ and $-w$ must have originally existed after $i$ and $u$, they would have disappeared as soon as they appeared. Such vocalic difficulties form an interesting parallel with Benedict's supposition (1972a:58-9, 1973b:7) of a basic Tibeto-Burman three vowel $i$, $u, a$ system in which only the vowel $a$ occurs with any regularity in open syllables that leads Matisoff (2003:159) to characterise it as a single vowel system of $a$ with a set of diphthongs.

Excluding those beginning with $e$ and $o$, due to Benedict's assumption (1972a:58-9) that the mid-vowels are generally secondarily derived, ${ }^{223}$ the diphthongs posited by Benedict are $-i j,-u w,-a(i) j$ and $-a(i) w$. Yet, these are not freely occurring diphthongs to which a consonantal coda may be added, but rather are closed rhymes with a $-j$ or $w$ coda that should not really be included in the vowel system. Notably Benedict (1972a:57) suggests modifying the diphthongs $-i j$ and $-u w$ to $-\partial j$ and $-\partial w$ which according to Matisoff (1985a:20) avoids an implicit length distinction between $-i$ and $-i j$ or $-u$ and $-u w{ }^{224}$ This introduces $a$ as a second vowel into the system which, following the regular lowering of Old Chinese $a$ to $a$ in Tibeto-Burman, noted by Benedict (1972a:183-4, 1973b:8-9), ${ }^{225}$ effectively establishes a vertical $\partial / a$ vowel system for Sino-Tibetan in open syllables and syllables closed with glides.

[^84]That such an interpretation represents a reanalysis rather than a rejection of the fundamentals of Benedict's system is shown by Matisoff's observation (2003:159) that the Tibeto-Burman vowel system corresponds to the two vowel system proposed by Hockett (1947:266-7) for Mandarin Chinese. While Matisoff seems to be using this analogy to justify his system in terms of phonological reality whereby any given language at a given time could develop into a system that may be analysed in this way, it is this same article by Hockett that Pulleyblank (1984a:46-57, 1984b) uses to justify his proposal for a basic $\partial / a$ system underlying the roots of Old Chinese.

### 5.1. Open Rhymes

### 5.1.1 High vowels -i and -u

Northern Chin $-i$ and $-u$ appear to correspond to Sino-Tibetan $a$ before $-j$ and $-w$ as they are reconstructed for Old Chinese: ${ }^{226}$

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $*_{-a j}$ | $-i$ | $-i j$ | $-\partial j$ |
| $*-\partial w$ | $-u$ | $-i w$ | $-\partial w$ |

## [\#39] Slingshot

[M] *laj (2003:192)
[P\&S] *lij (1996:\#1935)
[NC] ${ }^{11^{11}}$ slingshot $n$
[OB] ler" $600: / 0$ OS $1 \mathrm{ij} \mathrm{il}^{11}$ bow $n^{227}$

[^85][\#40] Sun
[M] *nəj (2003:191;464)
[P\&S] *nij (1996:\#581)
[NC] *nit sun, day n

 grammatically induced does not seem to fit the two areas of usage identified by Allott (1967:159-61): additive and attributive noun phrases; emphatic

 / Øjof rjak day (of 24 hours) $n$, suggests a possible attributive function that may have become lexically established:

day day not separate
Every day and night ${ }^{229}$ without break.
[C] qu ${ }^{\text {III }}$ 日 nit $<$ *nə̀c < *'njj-k sun, dayn
Sagart (1999a:175) observes a similarity in correspondences with blood $n$ which leads him to suggest that sun $n$ is also a Chinese loanword in TibetoBurman. An issue not addressed by Sagart is that here the tonal reflex is I whereas in blood $n$ it is II. The development of loanwords is not always consistent but the proposed development of $-\partial k^{j}>-\partial c>a j$ ? with a glottal catch supports the tone II reflex of blood $n$ much better. Bodman (1980:129), who also assumes this for blood $n$, and Baxter (1980:17) suggest that there may have been an original glottal stop in Old Chinese that was lost in TibetoBurman, but Baxter notes that this conflicts with the proposal to treat glottal stop as the source of tone II. Starostin (1995:237-8) prefers to assume a $-k$ suffix, as he also does in the case of blood $n$, but is unable to assign any specific function. The comparison with the velar suffix in $61^{\text {ill }} 夕$ ziajk $<*_{s}$

[^86]'lak evening $n$ depicting a moon $n$ in the earliest inscriptions suggests a similar temporal usage of the suffix.
[\#41] Smoke
[M] *kəw (2003:178;451)
[P\&S] *giw (1996:\#2052)
[NC] *k ${ }^{\text {h/ }} \mathrm{u}^{\text {II }}$ smoke $n / v i$

[OC] -
Benedict's (1972b:30) comparison of 6 yn $^{\mathrm{I}}$ 熏 xun $^{1}<$ *'xwon $^{1}$ smoke, steam $v i$ as a possible example of his proposed shift of tone II to I in the environment of an $-n$ suffix is queried in 6.5.2.

### 5.1.2 Low Vowel -a

Sino-Tibetan $-\partial$, which is still maintained in Old Chinese, has merged with $-a$ in Northern Chin in the same way as in Old Burmese:

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $*-a$ | $-a$ | $-a$ | $-a$ |
| $*-\partial$ | $-a$ | $-a$ | $-\partial$ |

## [\#42] Child

[M] *tsa 3 *za $(2003: 176 ; 450)$
[P\&S] *kz ${ }^{\text {hil }}$ (1996:\#1615)
[NC] *cka ${ }^{11}$ offspring $n$
[OB] $\theta a^{11} 20: \mathrm{sa}^{11}$ son $n$
The irregularity of the initial is ignored by Peiros \& Starostin; Matisoff (1978a:55, 1995:63) suggests that Lahu reflects allofamic variation in this root with $d z$ - when occurring as a prefix to boys' names and $z$ - with the meaning here. A possible solution is provided by the Chinese evidence below.
［OC］si ${ }^{\text {II }} \mathrm{E} \mathrm{zi}^{\text {II }}<{ }^{*}{ }^{\prime} \mathrm{za}^{\mathrm{II}}$ sixth earthly branch $n$
Matisoff and Peiros \＆Starostin compare tss ${ }^{18}$ 子 tsif ${ }^{11}<*^{\prime}$ co ${ }^{11}$ son，child $n$ but Sagart（1999b：165）suggests this meaning，as opposed to its use as a calendrical sign，to be internally derived from a verb meaning bear $v t$ associated with tsi $^{1}$ 仔 tsi $^{1 / / 1}<*^{1 /} \mathbf{c o}^{1 / / I I}$ burden $n$ such that the Tibeto－Burman correlates are Chinese loanwords．${ }^{230}$ Benedict（1972a：27）suggests an association with si ${ }^{\text {III }} 巳 \mathrm{zit}^{\text {II }}<*^{\prime}$ ze ${ }^{\text {II }}$ sixth earthly branch $n$ apparently on the basis of Karlgren＇s tentative treatment（1957：255）of it as depicting a foetus．${ }^{231}$ There is some palaeographical support to such an interpretation and Xu ＇s
 on the basis of their similar inscriptional forms of 9 and 9 is supported by his observation（1988：1575－6）of a graph $\mathcal{F}$ with an unclear meaning that appears to be an amalgam of the two．The source of Middle Chinese $z$－is also problematic；noting that it only occurs in words derived from Type $B$ syllables， Baxter（1992：206）suggests that Old Chinese＊z－may have merged with＊dz－ in Type A syllables．Alternatively，Sagart（1999b：29－30）proposes that Middle Chinese $z$－generally appears to result from an $s$－prefix before non－nasal voiced root initials such that ${ }^{*} z$－does not need to be reconstructed for Old Chinese．Sagart＇s proposal is eminently reasonable but Baxter＇s suggestion allows Old Burmese $s$－to be treated as a regular derivation from $z$－and allows an explanation for Northern Chin＊dz－to be made along similar lines to the proposed merger in Chinese．

## ［\＃43］Jaw

［M］$\quad$ ka（2003：486）
［P\＆S］＊${ }^{(\mathrm{h})} \mathrm{a}(1996 \# 2037)$

[^87][NC] *k ${ }^{\mathrm{h}}{ }^{11}$ jawn
[OB] (də)ga ${ }^{\text {II }}\left(\right.$ © $\left.^{\circ}\right)$ วl: $(\operatorname{tam}) \mathrm{k}^{\mathrm{h}} \mathrm{a}^{\text {II }}$ door $n$
[OC] -
The Old Burmese semantics make it tempting to associate hu ${ }^{\text {III }}$ 戶 $\mathrm{go}{ }^{\mathrm{II}}<$ gaa $^{\mathrm{II}}$ door $n$ but other Tibeto-Burman comparanda suggests the root meaning to be jawn. There is a possible association with Northern Chin *ka ${ }^{\text {II }}$ forked $v i$ and Old Burmese ka ${ }^{11}$ m: $\mathrm{ka}^{11}$ divaricate $v i{ }^{232}$ although the etyma under fork $v i$ in 6.5.4 suggest Mon-Khmer influence.

### 5.1.3 Mid-vowels -e and -o and Diphthongs - $1 a$ and -va

Benedict (1972a:58) supposes $\varepsilon / e$ and $\rho / o$, restricted in open syllables to $-e$ and $-o$, to be secondary derivations from $I a$ and $v a$ respectively but makes no attempt to account for cases where the diphthongs remain. Luce (1962a:55;57-9), who transcribes the Northern Chin distinctions $\varepsilon / e$ and $\rho / o$ as $\check{\varepsilon} / \varepsilon$ and $\check{\supset} / \rho$ (1962a:55) or $\varepsilon / \varepsilon:$ and $\rho / \rho:$ (1985:II. $70-87$ ), follows a proposal originally made in table II of Luce (1959a), to suggest conversely that the diphthongs derived from the vowel-breaking of original [e] and [ o ] vowels which he maintains to still be attested in Thado -ov [ $\mathrm{o}:$ ] and $-e_{\text {I }}[\mathrm{et}$ ]. Even without the recourse of Sino-Tibetan evidence favouring Benedict's proposal, a clear association in open syllables of the diphthongs with $\varepsilon / e$ and $\rho / o$ is found in the observations of Stern (1963:236), Henderson (1965:24) and Weidert (1975:69-70) that the diphthongs $-I a$ and $-v a$ surface as $-\varepsilon$ and $-\sigma$ when forming the short unstressed initial syllable of a disyllabic compound. A similar process occurs in certain verbal inflections as discussed in 1.4.1, and further evidence may be found in the occasional sporadic variation between diphthongs and pure vowels in some morphemes.

In a purely synchronic description, the restriction of the diphthongs to combinations with $a$ may simply be regarded as a feature of the phonological system requiring no further explanation; in diachronic terms such a treatment is not acceptable. That the syllable weight in the former part of Sizang ie is more likely a secondary development form an original placement in the latter part of the syllable, as in Tedim ra, is

[^88]supported by two pieces of evidence: the secondarily derived Sizang diphthongs $\varepsilon a$ and $\partial a$ have syllable weight in the latter part; on the basis of the available, albeit sporadic, evidence, the source of the diphthongs appears to be the medials $-j$ - and $-w$-, attested in Old Burmese and Old Chinese, before the $a$ vowel which before a simply merged to give $I / i$ and $v / u$. The source of the distinction between pure mid-vowels and diphthongs is not entirely clear. The limited comparative sets in closed syllables suggest an association of pure vowels with Old Chinese Type A syllables and diphthongs with Type B syllables, but this may well be coincidental. Unfortunately no comparative sets in open syllables have been discovered but the above discussion is supported by the closed syllable examples in 5.2.1.2 and 5.2.1.3 below. Corresponding to Sino-Tibetan $-j a$ and $-w a$ were $-j a$ and $-w a$. It will be seen below that in closed syllables these generally developed into $I / i$ and $\delta / u$. In open syllables the correspondences are hitherto limited to -wo in syllables corresponding to Old Chinese Type $B$ but this has interestingly undergone vowel lowering from $a$ to $a$ in spite of the preceding labial environment to give the following correlations: ${ }^{233}$

| ST | NC | OB | OC |
| :--- | :--- | :---: | :---: |
| $*-w a$ | $-v a$ | $-i w$ | $-w a$ |

## [\#44] Carry

[M] *ba (2003:24); *bəw (2003:44;178;199)
[P\&S] *p(u) $-\mathrm{k}(1996: \# 220) ;$ *p $^{\text {h }}$ əw (1996:\#254)
[NC] *pval carry on back vt
Superficially *pu ${ }^{\mathrm{I}}$ carry on shoulder vt appears to be a better comparison with the Burmese and Chinese forms but the tonal contours are tellingly irregular.
[OB] pov ${ }^{\text {II }} \varrho^{\circ}$ / $\oint \delta$ piw $^{\text {II }}$ carry on back $v t^{234}$
[OC] fut ${ }^{\text {III }}$ 負 buw $^{\text {II }}<*^{\prime}$ bwə ${ }^{\text {II }}$ carry on back $v t^{235}$

[^89]Baxter's comparison (1994a:31) of paw ${ }^{\text {II }}$ 抱 baw ${ }^{\text {II }}<$ *bow $^{\text {II }}$ embrace, carry in arms $v t$ concurs well with the Burmese form but fails to account for the Northern Chin vocalism.
[\#45] Village
[M] $\quad *_{r} / \mathrm{g}$-wa (2003:127)
[P\&S] *g( $)^{\text {wh }}$ (1996:\#2068); * ${ }^{\text {hw }} \geqslant(1996: \# 2575)$
[NC] ${ }^{*} \mathrm{k}^{\mathrm{h}} \mathrm{va}^{\mathrm{l}}$ village $n$
Matisoff (1972b:278) reconstructs ${ }^{*}$ grwa with the assumption that the velar initial has been treated like a prefix in Burmese and dropped while in Chin the $r$ has disappeared in the environment of the velar; this cannot be the case as Chin would have developed a retroflex initial.
[OB] -
Matisoff follows Benedict (1972a:109) in comparing jwa ${ }^{1}$ \& rwa $^{\mathrm{I}}$ village $n$ by treating initial $r$ - as a prefix and similarly demoting the $k^{h}$ - of Northern Chin to a prefixal status. Luce's observation (1959b:40) that in Old Burmese the word often had a larger sense of world $n$ does not in and of itself pose serious semantic difficulties according to the schema in Evans (1992:490), but Lehman's observations (1963:172-3) regarding the distinction between Northern Chin *k ${ }^{\mathrm{h}} \mathrm{oa}^{\mathrm{I}}$ village $n$ as the settled area with its semantic extensions of soul/spirit $n$ when contrasted with rem $^{1}$ forest, territory $n$, discussed under Forest (\#49), as the uncultivated wilderness cast serious doubts on the validity of Benedict's comparison. Phonological issues further compound these difficulties: in addition to the Chinese form below suggesting the initial $k^{h}$ - to be original and calling into question the vocalism, the word is often attested in the inscriptions with a superfluous final $-h$-טא which was also noted in the loanwords for Buddha and Brahmin in which the $-h$ in the latter word is
suggested in footnote 250 to be an artefact of the original Mon spelling. ${ }^{236}$ The fact that Bradley (1979:326) cannot find Loloish correlates for the Burmese word suggests an external source to be likely here as well. In what is often held to be the earliest Old Burmese inscription, ${ }^{237}$ the word for village $n$ is

This king subj slave three village EMPH wife dear ${ }^{238}$ to give REAL This king gave three villages of slaves to his dear wife. ${ }^{239}$

Although the use of $\sigma \rightarrow a w$ to spell words with a nucleus $-\bigcirc w a$ is shown by Ba Shin (1962:38-9) to be common in the inscriptional language, and may incidentally be observed in the spelling of س|§్ slave $n$ as cmpई in the above inscription, it was noted in 2.1.2 that the rhyme -waw is not possible in Old Burmese due to phonotactic constraints causing dissimilation to -aw. Luce (nd) notes that many Burmese village names preserve Old Mon names, and although the standard Mon word for village $n$ bears little resemblance to the Old Burmese form, Shorto (2006:560) notes a Palaung word which he transcribes as ru. In this regard, Ba Shin's observation (1962:36-7) that words rhyming in Inscriptional Burmese $-u$, corresponding to Old Burmese as $-w i t$ in the system used here, were often written with -aw makes this a very interesting correspondence.
[OC] t6 ${ }^{\text {hiou }}{ }^{\mathrm{I}}$ 丘 $\mathrm{k}^{\mathrm{h}} \mathrm{uw}^{\mathrm{d}}<*^{\text {' }} \mathrm{k}^{\mathrm{hw}} \partial^{\mathrm{I}}$ village, hillock $n$

Recognition of the above developments also helps accounts for the relationship between Northern Chin *koa ${ }^{\text {II }}$ nine vi and Old Chinese t6iou ${ }^{\text {II }}$ 九 $\mathrm{kuw}^{\text {II }}<*^{\prime} \mathrm{k}^{\text {w }} \mathrm{\partial w}^{\text {II }}$ nine vi. Matisoff (1980:17, 1997a:107) suggests that *koa ${ }^{11}$ may have developed via an $-a$ suffix from *kəw ${ }^{\text {II }}$-a but Weidert $(1981: 10 ; 12)$ queries Matisoff's division of the

[^90]rhyme in this manner. Alternatively Lehman (1973:520-1;544) proposes that it developed from a lost final - $l$ but Maran's proposal (1971:38) for final liquids in Old Burmese, upon which Lehman bases his argument, is incorrect. ${ }^{240}$ Karlgren's reconstruction (1957:260) of Old Chinese *kiugg, equivalent to ${ }^{*} k^{W} \partial$ in the system used here, is corrected by Baxter (1994a:30-1) but Karlgren's error actually hints at a solution. Baxter (1992:510) notes that words with labiovelar initials in '-aw dissimilated to - -a before undergoing rounding again later unless inhibited by a medial $-r$. Following Miller's proposal (1988:528), discussed in 6.5.4, that Tibeto-Burman numerals from two to nine are Old Chinese loanwords, it seems the word for nine $v i$ was borrowed across at the time of it rhyming as '-a from which it accordingly dipthongised to $-v a$ in the manner discussed above; the Burmese form also regularly

### 5.1.3.1 Prefix Induced Diphthongs

A further source of the Northern Chin diphthongs appears to be prefixation before $j$ and $w$ - when occurring as initials. ${ }^{241}$
[\#46] Rain
[M] ${ }^{\text {r-wa-s }}(2003: 173 ; 433)$
[P\&S] *r-q ${ }^{\text {hw }}$ (1996:\#2579)
[NC] ${ }^{*}$ r-wes rain $n$
The original word must have been *r-wes in order for Mizo, Zahau and Thado to develop roa?; an original *roas would have given roa ${ }^{\text {III }}$. ${ }^{42}$

Weidert (1987:97) notes this as an exception to his correlation of $-s$ and LoloBurmese tone II. Like its Loloish counterparts, this only occurs as a bound morpheme such that a sandhi shift of tone II to I in the latter syllable seems likely. Further support for this may be found in the association between sa ${ }^{11}$ ©っ:

[^91]$\mathrm{ca}^{\text {II }}$ eat $v t$ and əsa ${ }^{\mathrm{t}}$ ३ə๐ əca ${ }^{1}$ food $n$ which is plausibly a shortened form of

［OC］ $\mathrm{y}^{\text {II }}$ 雨 wua ${ }^{\text {III }}<*{ }^{\prime}$ wa ${ }^{\text {III }}$ rain vi
$\mathrm{y}^{\text {II }}$ 雨 wua，${ }^{\text {II }}<$＊＇$^{\text {wa }}{ }^{\text {II }}$ rain $n$
Both the verbal and nominal senses are attested in the earliest inscriptions． Whether the tone II reflex can be treated as a nominal derivative requires further investigation；see the discussion in 3．3．2．

今十一月其雨（HJ 12636）
this eleven month perhaps rain
In this eleventh month it may rain．${ }^{244}$
今一月帝令雨（HJ 14295）
this eleven month $\mathrm{Di}^{245}$ order rain In this eleventh month Di（will）order rain．${ }^{246}$

## 5．2 Closed Syllables

## 5．2．1 Unshifted

When the coda remains unaltered between Sino－Tibetan and Northern Chin，${ }^{247}$ the vocalic alternations appear to be generally what would be expected from the above discussion regarding open syllables．Specific developments conditioned by other codas will be discussed separately below．The discussion of closed syllables is constrained by the paucity of correspondence sets and it is expected that further details will be added to the system as new correspondences are discovered．

## 5．2．1．1 Pure Vowel

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $-\partial-$ | $-e / a-$ | $-a-$ | $-\partial-$ |
| $-a-$ | $-e / a-$ | $-a-$ | $-a-$ |

[^92]
## ［\＃47］Fathom

［M］$\quad{ }^{*} \mathrm{la}(\mathrm{i}) \mathrm{m}(2003: 251 ; 298)$
［P\＆S］＊lom（1996：\＃1705）；＊T－lam（1996：\＃1703；1887）
［NC］＊lam fathom $n$
There is some confusion here with Mizo ${ }^{\mathrm{h}} \mathrm{lem}^{1}$ and Zahau lem ${ }^{\mathrm{l}}$ fathom $n$ having the syllabic weight on the coda rather than the vowel．It is possible that the Thado，Zo，Tedim and Sizang forms were influenced by＊lam ${ }^{1}$ dance $v i$ due to the characteristic Northern Chin dancing style with arms outstretched．The aspiration in Mizo may be a back formation from ${ }^{\mathrm{h}} \mathrm{lem}^{\mathrm{L}}$ fathom $v t$ which is not attested in the other languages．
［OB］lã1 $\mathfrak{~} \operatorname{lam}^{1}$ fathom n／vt
［OC］ $6 \mathrm{yn}^{\mathrm{rb}} / \mathrm{gnn}^{\mathrm{rb}}$ 尋 $\mathrm{zim}^{\mathrm{T}}<*_{\mathrm{s}}{ }^{\text {＇}}{ }^{\text {lom }}{ }^{\mathrm{I}}$ measure of length $n$

## ［\＃48］Mouth

［M］$\quad{ }^{r}$ r－ka（：）m $(2003: 251 ; 298)$
［P\＆S］＊k ${ }^{\text {h }}$ əm（1996：\＃2291）；＊k ${ }^{\text {h }}$ 2：m（1996：\＃2294）
［NC］＊kem ${ }^{\mathrm{r}}$ mouth $n$
Matisoff glosses the Mizo form as bank，shore $n$ but this is a figurative usage of its root meaning mouth $n$ ；Peiros \＆Starostin＇s reconstruction of the different meanings under separate roots is unnecessary．Matisoff＇s association of Northern Chin $\mathrm{k}^{\mathrm{h}} \mathrm{am}^{\mathrm{III}}$ precipice $n$ ，in turn a nominal form 2 of $\mathrm{k}^{\mathrm{h}} \mathrm{am}^{\mathrm{I}}$ precipitous vi，may be valid but it would represent an ablaut variant as attested by his Chinese comparanda $\mathrm{k}^{\mathrm{h}} \mathrm{an}^{\text {III }}$ 墈 $\mathrm{k}^{\mathrm{h}} \mathrm{m}^{\text {III }}<*^{\mathrm{h}} \mathrm{k}^{\text {III }}$ cliff，bank $n$ and $t_{6}{ }^{\mathrm{k}} \mathrm{in}^{\mathrm{I}}$嶔 $\mathrm{k}^{\mathrm{h}} \mathrm{im}^{\mathrm{L}}<*^{*} \mathrm{r}^{\prime} \mathrm{k}^{\mathrm{h}} \partial \mathrm{m}^{\mathrm{L}}$ precipitous vi．${ }^{248}$

[^93]This mostly obsolete compound noun is noted in Luce (1977a:19, 1981:41); the $-m$ coda is sometimes omitted in the inscriptional form as the modern pronunciation would attest: ${ }^{249}$
 parrot Brahmin ${ }^{250}$ mouth inside excrement voids ${ }^{251}$ The parrot defecates inside the Brahmin's mouth. ${ }^{252}$

Matisoff and Peiros \& Starostin compare the tone II word kãa mé kam ${ }^{11}$ bank, shore $n$. As an individual word it appears to have lost its aspirated initial, attested in the inscriptions, which is still maintained in compounds like
 snout $n$. The semantic extension involved parallels that of Mizo above but the concomitant shift to tone II is not attested there.
[OC] $\operatorname{kan}^{1}$ 甘 $\mathrm{kam}^{1}<{ }^{*} \mathrm{kam}^{1}$ (sweet vi)
This now has a meaning of sweet vi but it appears in the earliest inscriptions as $\Theta$, a mouth $\forall\left(\mathrm{k}^{\mathrm{h}} \mathrm{ou}^{\mathrm{II}} \square \mathrm{k}^{\mathrm{h}} \partial w^{\mathrm{II}}\right)$ with a line inside, which, aside from functioning as a place name, is unclear in meaning. Boltz (1992:42) assigns it to a word family meaning close in/down on in which he also includes han ${ }^{1}$ 含 $\gamma^{\mathrm{I}}{ }^{\mathrm{I}}<$ 'gəm $^{\mathrm{I}}$ hold in the mouth as Qiu (2000:218-9) supposes the original sense of $\Theta$ to have been. It is perhaps of no coincidence that Thado, Zo, Tedim and Sizang also use $\mathrm{kam}^{1}$ mouth $n$ in a verbal sense, with a form 2 kam $^{\text {III }}$, to mean set a trap vt. In Mizo and Zahau this occurs as a derived form

[^94]kam $^{\text {rb }}$ which suggests the original tone I sense may have been intransitive as the Old Chinese forms would suggest．${ }^{253}$

## ［\＃49］Forest

［M］$\quad$ ram（2003：299－300）
［P\＆S］＊rom（1996：\＃708）
［NC］${ }^{*} \mathrm{rem}^{\mathrm{I}}$ forest，territory $n$
Shafer（1952：139）and Schuessler（2007：358－9）suggests there may be a Mon－ Khmer link；the forms in Shorto（2006：378）suggest the semantic fields to be somewhat different．
［OB］－
The forms in Shorto（2006：379）show Peiros \＆Starostin＇s comparison of jõ ${ }^{1}$ १่ rwim $^{1}$ cluster，clump $v i$ to rather be a Mon－Khmer loanword；this seems to be supported by the comparison in Hla Pe （1967a：85）．${ }^{254}$
［OC］ $\ln ^{\text {lb }}$ 林 $\lim ^{1}<*^{\prime}$ rem $^{\mathrm{I}}$ woods，forest $n$
$\operatorname{son}^{1}$ 森 $\operatorname{sim}^{\mathrm{I}}<{ }^{*}$ s－＇rəm＇dense trees，thicket $n$

## 5．2．1．2 Medial－j－

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $-j \partial-$ | $--/ i-$ | $-i-$ | $-j \partial-$ |
| $-j a-$ | $-\varepsilon / e-,-I a-$ | $-j a-$ | $-j a-$ |

## ［\＃50］Extinguish

［M］${ }^{\text {ss－mi：t／n（2003：519－20）}}$
［P\＆S］＊me（：）t（1996：\＃90）

[^95]［NC］${ }^{*}$ mit extinguish vi／t

 have eyes closed，doze vi via a gloss of ${ }^{\mathrm{h}} \mathrm{men}^{\circ} \oint_{\rho}{ }^{\circ}{ }^{\mathrm{h}}{ }^{\mathrm{m}} \mathrm{mit}$ as shut（the eye），wink； Matisoff prefers to simply treat them as allofamic variants in $-t$ and $-n$ ．This meaning in Burmese only occurs when preceded by the word for eye $n$ ，and Nishi＇s gloss（1974：4）of extinguish vt elsewhere in Lolo－Burmese makes Benedict＇s comparison appear rather forced．${ }^{255}$
 intently eye－seed not close look ATTR 7 days animmisam ${ }^{256}$ EMPH The seven days when he intently stared without closing his eyes is Animmisam．
［OC］mis ${ }^{\text {III }}$ 滅 mjiat＜＊＇mjət
The Middle Chinese rhyme of mie ${ }^{\text {III }}$ 滅 mjiat requires an Old Chinese reconstruction of＊＇mjat extinguish vt．However in the Shijing it appears to
 ＊mac blood $n$ also attest such a reading．However Pulleyblank（1983：441， 1995b；30，1996b：55）notes that the semantically very similar mic ${ }^{\mathrm{III}}$ 葴 met eliminate vt，for which Old Chinese＊mjat would be expected，is used interchangeably with mus＂${ }^{\text {II }}$ 末 mat $<$＊mat as a place name and further notes the similar usages of both of them as grammatical particles．This prompts him to suggest that some kind of prefixal element may have triggered the Middle Chinese front vowel which he suggests（1995b：30）to be a sibilant prefix but there is little evidence for such a development elsewhere in Old Chinese．It seems likely that mic ${ }^{\text {III }}$ 滅 mjiat＜＊＇mjot may in some dialects have undergone

[^96]the same lowering process that affected name $n$ and fire $n$ to then develop as if from mjàt while in others the medial $-j$ - may have palatalised the dental coda to $-c$ allowing it to rhyme as *'mjoc. The situation may be similar to that of
 Pulleyblank (1991a: 66). ${ }^{257}$

## [\#51] Braid

[M] *bjar $>{ }^{*}$ pjar (2003:360;401)

## ［\＃53］Warm

［M］$\quad *_{\text {s－lim }}$ § $*_{s-l u m ~}(2003: 272 ; 275 ; 496)$
［P\＆S］＊lim（1996：\＃1835）
［NC］＊hlom ${ }^{\text {l }}$ warm vi
［OB］loũ ${ }^{1}$ Qo lwim ${ }^{1}$ warm vi
${ }^{h} \operatorname{lou} \tilde{1}^{1} \not \mathfrak{g}^{[ }{ }^{1}{ }^{1}$ wim ${ }^{1}$ warm（oneself）vt
 with Mizo lom $^{\mathrm{ILb}}$ and Zahau ${ }^{\mathrm{h}}$ lom ${ }^{\mathrm{Ib}}$ from Northern Chin $*^{(\mathrm{hl})} \mathrm{lom}^{\mathrm{III}}$－s which derives from an $-s$ suffix on the form 2 inflection ${ }^{(1)} 10 m^{\text {III }}$ when used transitively as a form 1 verb．${ }^{262}$
［OC］roy ${ }^{\text {rb }}$ 融 juwn ${ }^{\mathrm{L}}$＜${ }^{\prime}$ lwam $^{\mathrm{I}}$ warm vt
The reconstruction of a bilabial coda in the above character which，judging by its phonetic，must have been created after the dissimilation $-m$ to $-\eta$ in the environment of the labial medial，follows Bodman＇s comparison（1980：124）of it with $6 \mathrm{yn}^{\mathrm{lb}} / \mathrm{gnn}^{1 \mathrm{~b}}$ 尋 $\mathrm{zim}^{\mathrm{I}}<$＊s $^{1}{ }^{1} 1 \ni \mathrm{~m}^{\mathrm{I}}$ measure of length $n$ when used as a jiajie ${ }^{263}$ character to mean warm $v t$ ；the use of 璕 in this way presumably

[^98]stems from the lack of distinctiveness of Sino-Tibetan medial -w- after and before labial codas or initials.

## [\#54] Round

[M] *zlum (2003:78;272)
[P\&S] *li(:)m (1996:\#1839)
[NC] *h ${ }^{\text {l }}{ }^{\mathrm{II}}{ }^{\text {s }}$ sphericalised $v i$
[OB] loũ" ${ }^{\text {º }}$ : lwim ${ }^{\text {II }}$ spherical vi

## [\#55] Swell

[M] $\quad *_{s-p}{ }^{w} \mathrm{wam} / \mathrm{p}(2003: 518)$
[P\&S] *[p $\left.{ }^{\text {h }}\right]$ uam (1996:\#223)
[NC] *poam ${ }^{1}$ unripe but swollen vi
[OB] $\mathrm{p}^{\mathrm{h}} \tilde{\mathrm{u}}^{\text {III }} / \mathrm{p}^{\mathrm{h}}$ wã̃III $\dot{8}$ 。 $\mathrm{p}^{\mathrm{h}}$ wam $^{\text {III }}$ plump $v i$
The tone III is derived and compares with Northern Chin form 2 *puam ${ }^{111}$. Matisoff (1972a:47) and Bradley (1979:175;364-5) propose a Lolo-Burmese allofam with a $-p$ coda with which Matisoff (2003:381) tries to associate Mizo bop hind-leg $n$. Matisoff's association may ultimately prove to be correct but further research is required. ${ }^{264}$ Notably, bop is the form 2 of bom ${ }^{111}$ swarm $v t$ in Thado, Zo, Tedim and Sizang, attested as bom ${ }^{\text {IIb }}$ in Mizo and Zahau, which makes an interesting parallel with the cases of Smell (\#96) and Snot (\#97) discussed in 7.5.1.

### 5.2.2 Coda-j

Excepting cases derived from Sino-Tibetan $-\partial j$ to give Northern Chin -I/-i, SinoTibetan $-j$ appears to have been maintained regularly. However, while laterals are regularly attested across the six languages here, Luce (1962a:55, 1962c) notes that in

[^99]Xôngsai, a dialect of Thado, $-l$ appears often to be in free-variation with $-j$ which corresponds to $-j$ in the six Northern Chin languages discussed here. ${ }^{265}$ Consequently, in spite of a Northern Chin $-l$ coda to be discussed below, it appears that the reflexes of Sino-Tibetan *-l have also merged with Northern Chin $-j:{ }^{266}$

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $*_{-j}$ | $-j$ | $-j$ | $-j$ |
| $*_{-} l$ | $-j$ | $-j$ | $-l$ |

[\#56] Water
[M] *twəj $(2003: 195 ; 451)$
[P\&S] *tuj (1996:\#990)
[NC] tuj" water n
The Xôngsai data in Luce (1962c:3, 1985.II:82) has a variant form tri ${ }^{11}$ which is compared in table A of Luce (1962a:59) to a Thado form til that is distinct from tojil ${ }^{\text {II }}$ as recorded here. Luce further compares Zahau $\mathrm{ti}^{\text {Ila }}$ with Thado til ${ }^{\text {II }}$ but the shift of $-o j$ to $-i$ after coronals, discussed in 1.4.2.2, is a regular process in Zahau that is not attested in Thado. Nevertheless, Benedict (1972a:26;45) reconstructs a root $* \mathrm{ti}(\mathrm{j})$ water $n$ which Matisoff (2003:435) treats as an allofam of *twaj, correlating with *twi(j) in Benedict's original formulation, that supports the $-l$ coda in the Old Chinese form below. Luce (1962a:59-60) similarly poses a single source with the suggestion that the shifting in syllable weight from the first part of the diphthong to the second part ultimately caused the loss of the labial feature. ${ }^{267}$ Notably, although Benedict's proposal (1939:225) for a semantic link between *tuj" water $n$ and *tuj egg $n$ is tentatively queried by Matisoff (2004:387), the Xôngsai form for egg $n$ in Luce (1962c:3, 1985.II:72) has the regular reflex tul ${ }^{\text {I }}{ }^{268}$

[^100]
Matisoff's reconstruction (2003:195) of a separate allofam *dwəj to account for the unaspirated initial in (ta)twer ${ }^{11}\left(\circ^{\circ}\right) 60^{\prime}$ : is shown to be unnecessary with the older Written Burmese form, cited in Luce (1981:17), and its corresponding inscriptional forms showing original aspiration that was lost in close juncture. ${ }^{270}$ The independent verb $\mathrm{t}^{\mathrm{h}}$ wer ${ }^{11}$ 60g: $\mathrm{t}^{\mathrm{h}} \mathrm{wij}{ }^{11}$ spit out $v t$ is most likely a back-formation. ${ }^{271}$
[OC] tssucii 水 t6wil ${ }^{\text {II }}<$ *'twal $^{\text {II }}$ water $n$

Starostin's suggestion (1995:241) that the doublet forms may be due to dialectal differences suggests the $s$ - prefix in the latter should be removed. Sagart (1999b:157-8) prefers to derive the two forms from ${ }^{* h} l$ - and ${ }^{*} t-l$ respectively on the basis of forms, including Northern Chin *loj ${ }^{\text {III }}$ river $n$, listed by Matisoff (2003:197) under *lwi(j) and Peiros \& Starostin (1996:\#1832) under *luj. ${ }^{272}$ Gong (1995:64) supports such an interpretation but the Northern Chin and Burmese evidence above favours Starostin's proposal.

### 5.2.2.1 Rhyme $-\varepsilon j$

The regular derivation of $\varepsilon$ in closed syllables from $j a$ would suggest that Northern Chin $-\varepsilon j$ should derive from Sino-Tibetan ${ }^{*}$-jaj or ${ }^{*}$-jal. This may be very tentatively suggested in the following example, although Sagart's alternative suggestion

[^101](1995b:353-4) that the Tibeto-Burman forms are Old Chinese borrowings of the word for tongue in Hakka and Cantonese remains possible in spite of the fact that the issue of taboo, proposed for the ascendancy of this word, is dismissed by Bauer (1988:152) as a myth:

## [\#57] Tongue

[M] *s-l(j)a-j (1995:71)
[P\&S] *laj (1996:\#1698)
[NC] ${ }^{*}$ lej ${ }^{1}$ tongue $n$
The Xôngsai data in Luce (1985.II:70) and table B of Luce (1962a) does not attest a variant with $-l$.
[OB] $\int a^{\mathrm{I}} \mathrm{cpp}^{\mathrm{h}}{ }^{\mathrm{lja}}{ }^{\mathrm{i}}$ tongue $n$
Bradley (1979:302-3) and Matisoff (1994b:50) ${ }^{273}$ reconstruct Lolo-Burmese *? $-l(j) a^{r}$ noting the Loloish languages do not support a medial $-j$-. It is unequivocally attested in the inscriptions:
 tongue one fathom protrude while suffer may ${ }^{274}$ ATTR EMPH May they (be the ones who) ${ }^{275}$ suffer while their tongues protrude one fathom.

There are no cases of -jaj in Burmese; on the basis of the merger of -waw with $-a w$, it seems likely that $-j a j$ would have merged with $-a j$. However, the evidence here suggests that it was rather the coda that was lost through dissimilation; further research is required. ${ }^{276}$

[^102]However，a well－supported alternative source of Northern Chin $-\varepsilon j$ is from Sino－ Tibetan＊－${ }^{*}$ in which the lateral coda seems to have triggered vowel lowering in Northern Chin in order to retain the coda to give $-\varepsilon j$ rather than $-i$ as in the case of＊－$\partial j$ ． Old Burmese，not having the luxury of vocalic options available to Northern Chin， simply loses the original coda but retains it in spirit by not undergoing lowering to $-a$ and instead remaining as $-\mathrm{i}^{277}$

| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $*_{-a l}$ | $-\varepsilon j$ | $-i$ | $-a l$ |

The data in Luce（1985．II：82）and table B of Luce（1962a）suggests this also occurred in Xôngsai where no variant in $-l$ is attested for the following words：

## ［\＃58］Fire

［M］＊mej（2003：206）
［P\＆S］＊me：j（1996：\＃84）
［NC］＊m ${ }^{\text {¹I }}$ fire $n$
［OB］mil ${ }^{\text {® }}$ \＆ $\mathrm{mi}^{\text {II }}$ fire $n$

Shafer（1952：158）suggests an Austroasiatic link but Starostin＇s（1995：230） rejection of any solid external links is more likely．
［OC］hus ${ }^{\text {II }}$ 火 xwa ${ }^{\text {II }}<$＊h $^{\text {mol }}$ fire $n^{278}$

[^103]The bilabial initial is justified internally by Sagart (1999b:158-9) via the
 tail $n$ as phonetic.
[\#59] Tail
[M] $\quad *_{\text {r-mej (1985a:31) }}$
[P\&S] *r-məj (1996:\#138)
[NC] *mej ${ }^{\mathrm{II}}$ tail n

[OC] weil ${ }^{\text {II }}$ 尾 muj ${ }^{\text {il }}<$ ' $^{\prime}$ mol $^{\text {II }}$ tail $n$
The $r$ medial in Old Burmese is not attested in Old Chinese or it would have developed into Middle Chinese milit this suggests it to be prefixal in origin.
[\#60] Foot, Leg
[M] *pej (2003:205-6)
[P\&S] *be(:)j (1996:\#6)
[NC] ${ }^{*} \mathrm{p}^{\mathrm{h}} \mathrm{Ej}^{\text {III }} \operatorname{leg} n$

$\mathrm{p}^{\mathrm{h}} \partial\left(\mathrm{wa}^{\mathrm{II}}\right) \ominus(\mathrm{ol} \mathrm{O}) / \$ \supset \mathrm{p}^{\mathrm{h}}\left(\mathrm{lwa} \mathrm{l}^{\mathrm{II}}\right)$ sole $n^{279}$

Mahākassapa sole OBJ worship ${ }^{280}$
Mahäkassapa worships the soles (of the Buddha).
The voiced variant $\wp \bigcirc \$ \delta$ is a later, and now defunct, corruption; cf. side $n$, father $n$, grandfather $n$ for similar cases. Hla Pe (1967a:84) suggests it to be a Mon loanword; while this is likely the case for the second syllable, the first syllable fluctuates in Mon between velar and dental articulations suggesting it

[^104]to be distinct in origin from the Burmese bilabial. Nishida's proposal (1968:22) that the first syllable of Burmese $p^{\text {h }} \partial n a ? ~ Q_{q} \delta \mathrm{p}^{\text {hill }}$ nap sandal, shoe $n$ appears to correspond to velar initials in several other Lolo-Burmese languages is rejected by Matisoff (1978b:30) due to Lahu not also attesting a bilabial initial as it should according to his labiovelar hypothesis discussed in 4.10.2. The expected development of $92 \mathrm{p}^{\mathrm{h}} 1$ wa $\mathrm{a}^{\mathrm{II}}$ to Written Burmese would be as $88: \mathrm{p}^{\mathrm{h}}$ rwa ${ }^{\text {II }}$ or 0 çs: $\mathrm{p}^{\mathrm{h}} \partial l w a^{\mathrm{II}}$. The earlier loss of the $i$ vocalism than in $\AA_{q} \delta$ is related to the complex initial cluster; a similar example may be found palwer ${ }^{1}$ Y\&88 pu ${ }^{\text {III }}$ lwaj flute $n$, nowadays written in a reduced form 068 , which may also be written $6<8$ prwer. ${ }^{281}$ The meaning of palm $n$ is expressed in
 syllable means hand $n$. Similarly, the $\varphi p^{\text {hh }} \mathrm{a}^{\text {III }}$ of Written Burmese $\mathrm{p}^{\text {h }}$ əwa $\mathrm{I}^{\text {II }}$ vol: $\mathrm{p}^{\text {hh }} \mathrm{a}^{\text {II }}$ wa ${ }^{11}$ may be treated as being semantically associated with foot $n$ as attested by the several modern compounds in which it occurs. The most likely course of events for the origin of $90 \mathrm{p}^{\mathrm{h}}$ lwa is that it is a reduced form of
 to give a meaning of sole $n$ (lit. foot-palm). Over time, the association of $\&$ $\mathrm{p}^{\text {limil }}$ with foot $n$ in contrast to con with hand $n$ must have made coలీ lak, or rather its reduced form $\propto \rho l$, somewhat redundant in the middle of the word such that it was lost due to analogical levelling to leave simply $\mathrm{p}^{\text {h }}$ 敉 ${ }^{\text {II }}$ vol: $p^{\text {h }} \mathrm{a}^{\text {III }} w a^{\text {II }}$.

### 5.2.2.2 Rhyme -aj

Benedict's proposal (1972a:62) for a length distinction to account for Tibeto-Burman ${ }^{*}-a j j$ giving Mizo $-a j$ and ${ }^{*}-a j$ and giving $-\varepsilon j$ is not supported here with Sino-Tibetan *-aj regularly deriving Northern Chin $-a j$ and vocalic length not playing a role: ${ }^{282}$

[^105]| $S T$ | $N C$ | $O B$ | $O C$ |
| :--- | :--- | :--- | :--- |
| $*_{-} a j$ | $-a j$ | $-a j$ | $-a j$ |

## [\#61] Middle

[M] *la:j (1985:28)
[P\&S] *laj (1996:\#1877)
[NC] *laj' middle, navel n
The homophonous Northern Chin gerundive marker is possibly derived from this.
[OB] (ә)le $\mathrm{e}^{1}(३$ з)

### 5.2.3 Coda -w

The derivation of Northern Chin $-0 /-u$ from Sino-Tibetan *- $\partial w$ was discussed above; elsewhere Sino-Tibetan $-w$ appears to have been retained regularly.

### 5.2.3.1 Rhyme -ow

The regular derivation of Sino-Tibetan -wa- to Northern Chin $-\delta / o$ - in closed type A syllables would suggest a derivation of -ow from *-waw. Regrettably, no good comparative evidence is forthcoming ${ }^{283}$ but, such possible cases aside, Matisoff (2003:224) notes an association of Northern Chin -ow and Old Burmese -wi which interestingly parallels the association of Northern Chin $-\varepsilon j$ with Old Burmese $-i$, as discussed in 5.2.2.1, on the opposite side of the vowel triangle. ${ }^{284}$ Unfortunately no Old Chinese comparanda have been found and, although an avenue for possible research is proposed in 7.2.3, the Sino-Tibetan source remains unclear.

[^106]| $S T$ | $N C$ | $O B$ | $O C$ |
| :--- | :--- | :--- | :--- |
| $-?$ | $-o w$ | $-w \dot{z}$ | $-?$ |

## [\#62] Boil

[M] *tsjow $(2003: 224 ; 227)$
[P\&S] *cu (1996:\#1170) ${ }^{285}$
[ NC ] ${ }^{*}{ }^{\text {sow }}{ }^{1}$ boil vi
[OB] su ${ }^{\mathrm{L}} \propto_{\mathrm{L}} \mathrm{c}^{\text {h }}$ wit boil vi
The word $\mathrm{su}^{\mathrm{I}} \otimes_{\text {Q }} \mathrm{c}^{\mathrm{h}} \mathrm{wi}^{1}$ can also mean thorn $n$ which Luce (1981:32) does not distinguish from su" $\mathbb{Q}^{11}$ : cwi ${ }^{11}$ awl n, pierce vt. As a verb, much as in English, its meaning may be extended metaphorically to seethe with emotion vi such that it seems highly likely that the nominal form $\mathrm{su}^{\mathrm{n}} \propto^{\circ} \mathrm{c}^{\mathrm{h}}$ wit $i^{11}$ thorn $n$, which, unlike
 nominalised semantic extension of the concept prickling with emotion vi. ${ }^{286}$

## [\#63] Soft

[M] *now (2003:224)
[P\&S] *nu (1996:\#611)
[NC] *now ${ }^{\text {II }}$ young $v i$
[OB] nu ${ }^{\text {II }}$ sit nwi ${ }^{\text {II }}$ soft $v i$
${ }^{1} \mathrm{nu}^{\mathrm{II}}{ }_{\mathrm{git}}{ }^{\mathrm{h}}{ }^{\mathrm{n}} \mathrm{nwit}{ }^{\mathrm{II}}$ soften $v t$
Matisoff (1978b:27) suggests the tone III word nu ${ }^{\text {III }}$ \& nwit iII soft vi derived
 soften $v t$. It is distinguishable occasionally by a sense of fine vi rather than tender $v i$ and probably represents a back-formation of the Pali loan ənu ${ }^{\text {III }}$ зәоァ!

[^107]onwit ${ }^{\text {III }}$ used to refer to minute objects；Stewart \＆Dunn（1940－81：203）note it can also be written ənu ${ }^{\text {III }}$ эวฐ ənwit $^{\text {III }}$ making it identical with the nominalised form of nu ${ }^{\text {III }}$ \＆nwit ${ }^{\text {III }}$ soft $v i$ ．Both cases appear in the inscriptions where the use of $_{\overline{\mathfrak{l}}}$ as opposed to $\bar{\pi}$ makes an unmarked tone III in the former case unlikely：

568つ界（OBEP 44a） cucumber ${ }^{287}$ soft Tender Cucumber．${ }^{288}$

grass soft water clear
Soft grass and clear water．
［OC］－
 nuw ${ }^{\text {III }}<*^{\prime}$ nəw ${ }^{\text {III }}$ soften $v t$ is tantalizingly close but only the initials correspond regularly．They appear to be ablaut variants of qu $u^{\text {lb }}$ 儒 nua ${ }^{\mathrm{I}}<$＊＇naw $^{\mathrm{I}}$ weak $v i$ discussed under Child（\＃64）although the Tibeto－Burman forms being Old Chinese loanwords remains a possibility．

## 5．2．3．2．Rhyme－aw

Benedict＇s proposal（1972a：62）for a distinction between Tibeto－Burman＊－a：w giving Mizo－aw and＊－aw giving－ow is，like the case with $-j$ above，not supported here where＊－aw regularly derives－aw．

| $S T$ | $N C$ | $O B$ | $O C$ |
| :--- | :--- | :--- | :--- |
| ＊－aw $^{-a w}$ | $-a w$ | $-a w$ | $-a w$ |

## ［\＃64］Child

［M］＊na：w（2003：225－6）
［P\＆S］＊nəw（1996：\＃601）
［NC］＊naw＇childn

[^108]［OC］ \｛u $^{\text {Lb／III }}$ 需 nua ${ }^{\text {III }}<*^{\prime}$ naw $^{\text {III }}$ child $n$
Schuessler（2007：445）notes that the modern tone I is unexpected；he suggests it may be the same word as $\chi^{\text {b }}$ 儒 nua ${ }^{1}<*^{\prime}$ naw ${ }^{\mathrm{I}}$ weak vi that develops the tone III reflex，and graphic alteration，when occurring as an adjective（ $=v i$ ）for 子 child $n .{ }^{289}$

## 5．2．3．3．Sino－Tibetan－K

The merger of $-\xi$ with $-w$ between Old and Middle Chinese，as discussed in 3．2．5， appears to be paralleled in Northern Chin where Sino－Tibetan $-\kappa$ appears to have merged with $-w$ ：
［\＃65］Fat
［M］＊sarw（2003：225；227）
［P\＆S］＊st ${ }^{\text {l／}}$ a：w（1996：\＃1207）
［NC］＊t ${ }^{\mathrm{h}} \mathrm{aw}^{\mathrm{L}}$ fat vi，grease n
［OB］－
Peiros \＆Starostin reconstruct $t^{h}{ }^{h}$－to account for a comparison with su ${ }^{1}$ on ＊ $\mathrm{c}^{\text {h}}{ }^{\text {wi }}{ }^{1}$ fat $v i$ which was originally proposed by Matisoff（1974：189）but later retracted（2001：14）．
［OC］sau＇臊 saw $^{\text {¹ }}<{ }^{*}$ sas $^{1}$ fat $n$

Another possible case is Peiros \＆Starostin＇s comparison（1996：\＃2303）of Mizo kow ${ }^{\text {II }}$ call $v t$ to hau ${ }^{\text {b }}$ 號 yaw ${ }^{\text {＜}}{ }^{*}$－as＇shout，cry out $v t$ if the Old Chinese forms is reconstructed with ${ }^{*} g^{W}$－rather than plain ${ }^{*} g$－．Matisoff（2003：225）adds Burmese $\mathrm{k}^{\mathrm{h}} \mathrm{J}^{\mathrm{I}}$

[^109]may also be added here，suggesting Shafer＇s proposal（1952：145），supported by the forms in Shorto（2006：474），for a Mon－Khmer association to be valid．

## 5．2．4 Liquid Codas

Benedict（1940：114－27）gives a lengthy treatment to the codas $-r$ and $-l$ and their confusion with $-n$ in Tibeto－Burman but does not manage to clearly disambiguate them．${ }^{290}$ Peiros \＆Starostin（1996），as discussed in Peiros（1998：215）and Baxter （1995：5），attempt to account for the difference by reconstructing a velarised lateral $-t$ coda for cases where Old Chinese $-n$ corresponds to Tibeto－Burman $-l$ in Benedict＇s system．Starostin（2004：68）is unable to identify a source for the distinctive $-\downarrow$ but his choice of phoneme is undoubtedly influenced by his broader ruminations regarding links with Caucasian languages．It seems likely that it is simply a representation in other Sino－Tibetan daughter languages of the dialectal shift of $-r$ to Old Chinese $-l$ and －$n$ proposed by Starostin（1989：338－41）but treated by him as $-j$ and $-n .{ }^{291}$ Matisoff （2003：383）suggests that the Written Burmese reflexes of Tibeto－Burman＊－$r$ may be conditioned by the preceding vocalism．Unfortunately there is not enough evidence to test such a hypothesis fully but the possibility that the two dialect developments of Sino－Tibetan ${ }^{*}-r$ proposed below are not mutually exclusive of one another remains open．${ }^{292}$ At any rate，Old Burmese $-n$ appears to be exclusively derived from Sino－ Tibetan $-n$ with proposed associations with Northern Chin rhotics or laterals being unlikely．

## 5．2．4．1 Rhotic－r

As with initial ${ }^{*} r$－，discussed in 4．3，occlusion has occurred in the Tedim and Sizang reflexes of $-r$ to give $-k$ which is by default unreleased and unvoiced in coda position． The Thado and Zo reflex has further developed to $-?^{293}$ with Zo showing a further

[^110]alternation with $-a$ as discussed in 1.4.2.4. Matisoff's (2003:392) and Peiros \& Starostin's (1996:\#249) comparison of pã̃ 0 §§: pan ${ }^{11}$ flower $n$ with Mizo par' flower $n / v i$ is supported by Weidert (1987:132), but a Loloish cognate is not attested and Luce's suggested association (1981:52) of pã 0 § pan $^{1}$ adorn $v t$ is supported by Bernot's glosses (1978-92:X.16;19) of pã ${ }^{\text {II }}$ ט§ీ: pan ${ }^{\text {II }}$ as floral decoration/motif $n$ and pã ${ }^{1} 0 \S$ pan $^{1}$ as wear a flower or jewellery on the head or ear vt. ${ }^{294}$ Removing an association with Old Burmese $-n$ allows the following correspondences to be proposed: ${ }^{295}$

| ST | NC | OB | OC |
| :--- | :--- | :--- | :---: |
| ${ }^{*}-r$ | $-r$ | $-\varnothing$ | $-n$ |

[\#66] Nose
[M] $\quad *_{\text {s-na }} \not *_{\text {s-narr }}(2003: 103 ; 427)$
[P\&S] *s-na (1996:\#516); *s-na:r (1996:\#555)
[NC] *hnar ${ }^{1 /[1]}$ nose $n$

* ${ }^{\mathrm{h}}$ nar ${ }^{\mathrm{l}}$ snore, breathe $v i$

The fluctuation in tones of Northern Chin is due to some forms correlating with *h nar ${ }^{\mathrm{I}}$ snore, breathe vi and others with its form 2 inflection ${ }^{\text {h }}$ nar ${ }^{\text {III }}$ (< ${ }^{* h}{ }^{\text {n }}{ }^{1}{ }^{1}-$ s). ${ }^{296}$ Benedict (1988a:260-1) suggests that the $-r$ coda is a suffix, and at the root level a better Chin comparison is Mizo ${ }^{\mathrm{h}} \mathrm{na}^{\text {III }}$ source (of stream/river), spring $n$ which is semantically linked to some of the more figurative uses of *h $^{\text {h }}{ }^{1 / / 1 I I}$ nose $n .{ }^{297}$

[OC] $\mathrm{t}^{\mathrm{th}} \mathrm{an}^{\text {III }}$ 嘆 $\mathrm{t}^{\mathrm{h}} \mathrm{an}^{\mathrm{III}}<*_{\mathrm{s}}-\operatorname{nan}^{\mathrm{III}}$ sigh $v i$

[^111]
## [\#67] New

[M] *g-sar (2003:391;402)
[P\&S] *ts ${ }^{\text {har (1996:\#1205) }}$
[NC] *t ${ }^{\text {h }}{ }^{\text {er }}$ new $v i$
[OB] $Ө \mathrm{a}^{\text {III }} \leadsto>\mathrm{sa}^{\text {III }}$ titivate $v t$
This is proposed by Gong (1995:69) and may represent a transitive derivation
from an original tone I that would correlate with Northern Chin form 2 * $t^{\mathrm{h}} \mathrm{er}^{\mathrm{II}}$.
[OC] 6ien ${ }^{\mathrm{I}}$ 鮮 $\operatorname{sian}^{1}<$ *'san $^{1}$ fresh $v i$

### 5.2.4.2 Lateral - 1

Proposed correspondences of Old Burmese $-n$ with Northern Chin - $l$ appear unlikely. ${ }^{298}$ This allows the following to be proposed in which the dialectal shift of *-r to $-l$ must be assumed to have occurred after the shift of the original lateral coda to $-j$ had already taken place: ${ }^{299}$

| ST | NC | OB | OC |
| :--- | :--- | :--- | :---: |
| $*_{-r}$ | $-l$ | $-j$ | $-l$ |

[^112]［\＃68］Body－Hair
［M］$*_{\text {s－mul }}(2003: 419 ; 423)$
［P\＆S］＊mul（1996：\＃158）
［NC］＊h mol ${ }^{11}$ hair（body）$n$
［OB］mwer ${ }^{11}$ © $8: / Q Q_{0}$ mwij ${ }^{11}$ hair（body）$n$

Unfortunately this has only been identified in the inscriptions as a place／personal name．Its graphic form consists of a person $\uparrow$（大）with head plumage that in many instances appears to have been stylised into ram＇s horns $\psi$（羊 sheep $n$ ）．The areal semantic association of feather $n$ and fur $n$ ， noted in Matisoff（2004：357－8），makes the graphic confusion of feathered plumage with a woolly sheep not difficult to conceive．A semantic extension to beautiful vi is also plausible considering the verbal sense of English plume is essentially that of preen．${ }^{300}$ Perhaps also of note is the phonologically very similar $\mathrm{mei}^{\mathrm{ib}}$ 眉 $\mathrm{mi}^{\mathrm{i}}<{ }^{\mathrm{r} r-\mathrm{mw}}{ }^{\text {m }}{ }^{\mathrm{l}}$ eyebrow $n$ with which Sagart（2005：163） suggests an Austronesian link supported in Matisoff（1976a：272）．

## ［\＃69］Snake

［M］＊m－ru：l（2000：169－70）
［P\＆S］＊Pru：l（1996：\＃407）
［ NC ］＊rul＇snake n
［OB］mwer 6 ／
Matisoff suggests the bilabial prefix may be derived from＊bow insect，bug， vermin．${ }^{301}$ It is possible that the prefix was added in Burmese to distinguish it from the word jweri＂ฮg：／ఇu์ rwij＂creeper $n$ with which it would otherwise

[^113]have become segmentally homophonous and would only have been distinguishable via tone．
［\＃70］Congeal
［M］＊kal（2003：405－6）
［P\＆S］＊g ${ }^{\text {h }}$（1996：\＃2049）
［ NC］${ }^{*} \mathrm{k}^{\mathrm{h}} \mathrm{el}^{\mathrm{II}}$ solid，congeal vi
Benedict（1972a：15）suggests an alternative comparison of Mizo $\mathrm{k}^{\mathrm{h}} \mathrm{ar}^{\mathrm{II}}$ close shut vi／t with a gloss of congeal vi．This latter gloss is actually a figurative usage of its original sense whose form 1 can occur as a noun meaning crust， dam，glutinous mass $n$ in Mizo and Zahau．
［OB］ $\mathrm{k}^{\mathrm{h}} \mathrm{e}^{\mathrm{II}}$ る／ə山今 $\mathrm{k}^{\mathrm{h}} \mathrm{aj}^{\mathrm{II}}$ congeal，freeze $v i$
This can also mean lead（metal）$n$ ，the soft and coagulated nature of which makes it likely that they reflect the same proto－form．Peiros \＆Starostin （1996：\＃2077）and Matisoff（2003：390）attempt to compare it with Mizo har ${ }^{\text {III }}$ pewter，solder $n$ and Tedim hak ${ }^{\text {III }}$ lead $n$ respectively but the Burmese form would not then attest the palatal coda．

## 5．2．5 High Vowel I／i before $-\mathrm{k} / \mathrm{\eta}$ and $-t / \mathrm{n}$

It was shown in 5．2．1．2 above that Sino－Tibetan－jo－regularly gives Old Burmese $\dot{\boldsymbol{i}}$ and Northern Chin $I / i$ ．Very limited evidence suggests an exception in Old Burmese rhymes derived from an original uvular $-q$ coda where it may have prevented medial－ $j$－from inhibiting the regular lowering of $\partial$ to $a$ ：
［\＃71］Eye
［M］＊mik $¥$＊mjak（2003：347；506）
［P\＆S］＊mjVk（1996：\＃109）
［NC］＊mit eyen

The $-t$ coda results from palatalisation of the original $-k$; this is supported by some Southern Chin data in Luce (1985:II.78-9) where a final $-k$ is still attested.
[OB] mje? খูృֹ mjak eye n
Nishi (1977:44) notes a very rare spelling with medial $-l$ - as ঞ઼๗์ mlak but this is most likely due to scribal error with this common inscriptional word being otherwise universally attested with $-j-:^{302}$

eye ${ }^{303}$ one side also blind REAL
His eye also becomes ${ }^{304}$ blind on one side.
The Burmese vocalism forces Matisoff to suggest allofamic variation which French (1983:280-1;484) is also forced to assume for Northern Naga. Benedict (1976a:179) prefers to reconstruct a single form *mjok eye $n$ but the difficulties associated with this are discussed in 7.5.2. ${ }^{305}$ What seems to have happened is that the original uvular coda $-q$, that merged with $-k$ in Burmese, prevented the schwa from fronting to $i$ after the palatal medial such that it lowered to $a$ in the regular manner for a non-palatal environment; it appears to have had no such effect in Northern Chin. Shafer (1952:148) and Stewart \& Dunn (1940-81:280) suggest a possible relationship with Mon, and Hla Pe (1948:65) notes a semantic connection with Mon in the extension of the meaning eye $n$ to jewel $n$. The phonological difficulties in associating the Mon form means Benedict (1967:283) and Starostin (1995:230) are probably correct in dismissing the association. ${ }^{306}$

[^114][OC] mu ${ }^{\text {III }}$ 目 muwk < *'mjəq eye n
The reconstruction of a uvular coda follows Pulleyblank (1977-8:200). ${ }^{307}$
The more general source of $-1 / i$ - before $-k / \eta$ and $-t / n$ appears to be the original SinoTibetan palatal codas $-k^{j}$ and $-\eta^{j}$. Pulleyblank (1979:29) assumes that Old Chinese -c and $-n$ developed a velar articulation after $a$ as Middle Chinese $-j k$ and $-j \eta$ but a coronal articulation after $a$ as Middle Chinese -t and $-n$. He later (1991a:47) emends the Old Chinese reconstruction to $-k^{j}$ and $-\eta^{j}$ which gives better symmetry with his reconstruction of labiovelars $-k^{w}$ and $-\eta^{w}$ and conversely suggests that the velar articulation fronted to a coronal one in the environment of the higher vocalic nucleus. ${ }^{308}$ The Old Burmese correspondence of $-a c$ and $-a n$ with Old Chinese $-\partial c /-a c$ and $-\partial n /-a n$ provides no support for a velar articulation but the Northern Chin reflexes of $-I k /-i k$ and $-I m /-i j$ which like Burmese have merged the Old Chinese distinction of $a$ and $a$ show clear evidence for a velar articulation. Somewhat obfuscating the issue are the Northern Chin reflexes of -It and -In which, unlike in Old Chinese where this represents $\partial$ instead of $a$ as the vocalic nucleus, exemplify a steady, but both crosslinguistically and within individual languages, sporadic shift of -Ik and -Im to -It and in in Northern Chin. In a few cases there appears to be no trace of the original velar in the six languages although occasionally it may be confirmed on the basis of Southern evidence. ${ }^{309}$ Pending the discovery of correspondence sets, it also remains unclear what effect a preceding labial element in the initial complex had before the codas $-k^{j}$ and $-\eta^{j}$; it was noted in 2.1.3.3 that the few cases in inscriptional Burmese of medial $w$ - before $-c$ and $-n$ are only of very limited use in this regard. For the time being the following correspondences may be reconstructed: ${ }^{310}$

[^115]| ST | NC | OB | OC |
| :--- | :--- | :--- | :--- |
| $-\partial h^{j}$ | $-\mathrm{I} k(f) /-i k(/ t)$ | $-a c$ | $-\partial c$ |
| $-a k^{j}$ | $-\mathrm{I} k(/ t) /-i k(t)$ | $-a c$ | $-a c$ |
| $-\partial \eta^{j}$ | $-I \eta(/ n) /-i \eta(/ n)$ | $-a n$ | $-\partial n$ |
| $-a \eta^{j}$ | $-\mathrm{I} \eta(/ n) /-i \eta(/ n)$ | $-a n$ | $-a n$ |

［\＃72］Name

[^116]
### 5.2.5.1 Matisoff's Bilabial Coronalisation after $\mathrm{I} / \mathrm{i}$

Matisoff suggests original $-p$ and $-m$ codas may have fronted to $-t$ and $-n$ in the
 down vi (2003:499-500;533); ${ }^{315}$ Mizo $\mathrm{m}^{1}$ drink vt and Chinese in ${ }^{\text {II }}$ 飲 $*$ ?im ${ }^{\text {II }}<{ }^{\prime}$ '? ${ }^{\text {II }}$
 (2003:273;533).

In the first case, while some Southern Chin evidence in Luce (1985:II.78-9) does suggest an original $-p$ coda, Shafer (1952:124;158), whose data is supported in Shorto (2006:239), shows the dental coda in Zahau to have been clearly influenced by MonKhmer. Furthermore the correspondence of $-p$ and $-t$ appears to be inverted in Matisoff's comparison (2003:533) of Mizo ip bag $n$ and Burmese ei? ふْ๐ீ ใjit bag, sack $n$ which confronts additional problems with the $d$ - initial in Zahau and Thado dip. ${ }^{316}$ In the remaining two cases, the tonal correspondences are irregular: Matisoff reconstructs the former under a root *Tam which supports the regular lowering of Old Chinese $a$ to $a$ in Tibeto-Burman but makes no account for the Northern Chin vocalism whose restricted distribution in only Mizo and Zahau suggests its affiliations may lie elsewhere; in the latter, an $-m$ coda is attested in some of the Southern Chin languages in Luce (1985:II.82-3) but Weidert (1987:108) notes this root to be unique in an almost clean split between Chin and Naga languages in tone II and Lolo-

[^117]Burmese and Barish languages in tone I which suggests the word may have been loaned from Burmese into Northern Chin later than in the more heavily Burmanised Southern Chin languages during the intermediary $-n$ stage before $-m$ was dropped to leave nasalisation of the preceding vowel. ${ }^{317}$

### 5.2.6 High Vowel U/u before -k/n

The Sino-Tibetan labiovelar codas $-k^{w}$ and $-\eta^{w}$ appear to have merged as -vk/-uk and $u \eta /-u \eta$ in a similar manner to the merger of the palatal codas $-k^{j}$ and $-\eta^{j}$. No comparative sets demonstrating the effect of a preceding palatal element on the rhymes have been proposed such that a definitive statement as to whether SinoTibetan $-j a k^{w}$ becomes Northern Chin $-\delta k$ or $-\varepsilon k$ will have to await the discovery of further evidence.

| ST | NC | OB | OC |

## 

An association of Tibeto－Burman $-s$ with Mizo－ 3 is noted in Benedict（1972a：16）． Focusing on Tedim，Ostapirat（1998：239－40）develops Benedict＇s observation by proposing that $-s$ developed regularly to $-h$ but then glottalised after vowels surfacing as short while developing into tone III after vowels surfacing as long．Rather than treating $-s$ purely as a suffix which would presuppose a typologically rare surface vocalic length distinction in open syllables，Ostapirat appears to be proposing a distinction between root final $-s$ on open syllables and a suffixal $-s$ that could be added to all syllable types．Whether this reading of Ostapirat is correct or not，such a distinction certainly appears possible；the role of suffixal $-s$ will be discussed
extensively in Chapter 7. Ostapirat's proposed developments of root final $-s$ in Tedim are tabulated below, along with the other five languages, with $e / a$ being used for purposes of exemplification only:

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $*_{-}-e s$ | $-\varepsilon ?$ | $-\varepsilon ?$ | $-a^{\text {III }}$ | $-a^{I I I}$ | $-e ?$ | $-a^{\text {III }}$ |
| $*_{-}-a s$ | $-a^{\text {III }}$ | $-a^{I I I}$ | $-a^{I I I}$ | $-a^{I I I}$ | $-a^{I I I}$ | $-a^{\text {III }}$ |

Such a distinction does not appear to be relevant for Old Chinese, but Weidert (1987:83;95-6) occasionally struggles with an apparent flip-flop of Lolo-Burmese tone II and Chinese tone III, and further struggles to reconcile his splitting of tone III into separate $-h$ and $-s$ categories which he uses to account for a merger of his $-s$ category with Lolo-Burmese tone II. On the basis of the correspondence sets below, the following correspondences may be tentatively suggested in want of further evidence:

| $S T$ | $N C$ | $O B$ | $O C$ |
| :--- | :--- | :--- | :--- |
| $*_{-S}$ | $-? /{ }^{\text {III }}$ | $-I I$ | - II |
| $*_{-S}$ | $-I^{I I}$ | - II | - II |

[\#78] Bone
[M] *g-rus (2003:435;465)
[P\&S] *ri-t/s (1996:\#703)
[NC] *ros bone n

[OC]
 bone $n$ is difficult to make both in terms of initials and rhymes. Furthermore, although later semantic divergences are possible, Hla Pe's observations (1948:65) of a semantic association of the Burmese form with lineage, stem $n$ puts it in an entirely different semantic field from Serruys' connection (1982:462) of the Chinese word with omen $n$ as characterised by the
divinations in Shang China. Sagart's proposal (2005:163) for an Austronesian link is preferable. ${ }^{318}$

## [\#79] Palm, Sole

[M] *p ${ }^{w} \mathrm{a}$-k (2000a:155-7)
[P\&S] *Pa (1996:\#332)
[NC] *p ${ }^{\mathrm{h}}$ es splay $v t$
In Mizo this means palm $n$ or sole $n$ when preceded by kot hand $n$ or ke ${ }^{\text {III }}$ foot respectively. ${ }^{319}$
[OB] $\quad\left(p^{\text {h }} \partial\right) w a^{\text {II }}(\omega) 01 \% / \propto 0\left(p^{\text {h }} 1\right) w a^{\text {II }}$ sole, palm $n^{320}$
Benedict (1972a:100) suggests the initial part of the compound to be the only one of his comparanda that does not mean hand $n$ or foot $n$; the discussion under Foot, Leg $n$ (\#60) identifies such a meaning in Burmese. Matisoff (1972a:34) criticises himself for his earlier accidental conflation of $\left.p^{\mathrm{h}} \varepsilon\right\}$ טא
 to compare it here by adding a $-k$ suffix; ironically it seems his association with side $n$ was correct with the voiced variant in the latter being a result of secondary voicing as discussed in 2.2. Matisoff (1969:197) suggests a possible association with $\left.k^{h} w a^{\mathrm{l}} \quad\right)^{\mathrm{k}^{\mathrm{h}} w a^{\mathrm{I}}}$ hoof $n$ via a velar animal prefix but an account must be made for the discrepant tone. Sagart's proposal (2005:163) for an Austronesian link may also be noted.

[^119]
## Chapter 6: Northern Chin Tones

Luce's division (1959a:28-9, 1985:I.83) of Chin tones into three categories, with Mizo and Zahau undergoing a later split of tone category II, was noted in 1.6. Löffler's suggestion (2002b:128) that tones I and II are primary fits well with the common association of tone III with derived verbal and nominal forms, to be discussed in Chapter 7, that pertains equally to Old Burmese and Old Chinese. It also bolsters Benedict's proposal (1972b:27, 1973a:129) for a Sino-Tibetan two tone system with a peripheral third tone; the segmental origin of this system will be discussed below. ${ }^{321}$ The association of tone II(b) with obstruent codas is discussed in 3.4 and 6.1 with the suggestion that surface vowel length before obstruent codas is a concomitant realisation of the tonal contour and therefore a secondary development. The fact that stopped syllables were originally not able to bear tone suggests that rather than following Weidert (1975:4-8) in his synchronically reasonable decision not to note the vowel distinction before obstruent codas, it would be preferable in diachronic terms not to note the tonal distinction. ${ }^{322}$ This approach is prevented by the need to further distinguish verbal inflections in tone III and onomatopoeic words or loanwords in tone I with obstruent codas. Consequently, both vocalic and tonal distinctions are noted before obstruent codas in the reconstructed roots in the word list.

Matisoff (1973a:81-4) finds too many exceptions to Benedict's proposal and prefers to treat Tibeto-Burman tonogenesis as a cyclical process that occurs independently in different languages but along similar principles. A similar opinion is voiced by Weidert (1987:491) who ultimately rejects his own proposal (1979:224) to reconstruct the Sino-Tibetan tonal system back to four phonation types of I voice - $\varnothing$, II creak $-^{2}$, III breath $-^{h}$, IV whisper $-^{s}$. Alternatively, Sagart (2006a:212-3) speculates on purely typological grounds that Benedict's analysis may be correct if tone II is assigned the same glottalic origin as in Old Chinese. Benedict (1988b:7) is reluctant to accept such a proposal due to glottality being attested in tone III in Burmese rather than tone II but does modify (1984:65-6) his original low and high tones I and II to falling and rising

[^120]as an attempt to accommodate the evidence for glottality in the latter；Weidert （1987：83）similarly struggles with the supposed flip－flop in Burmese and Chinese of tones II and III，and further struggles to reconcile his splitting of tone III into separate－ $h$（III）and $-s$（IV）categories which，of relevance to the languages discussed here，he uses（1987：95－6）to account for a merger of his tone IV with Lolo－Burmese II．Both these issues were addressed in 2．4．1 and 5．2．7 respectively，but Benedict（1973a：128， 1991：16）explicitly rejects the Old Chinese $-s$ hypothesis to instead（1972a：159；169） associate a Tibeto－Burman $-s$ coda with Old Chinese $-t$ which he further extends （1973b：4，1979：28，1987：27－8）to suffixal－s．${ }^{323}$ He premises this on three comparative sets of which bone $n$ is dismissed under Bone（\＃78），seven $v i$ is identified as a Chinese loanword into Tibeto－Burman in 6．5．4，${ }^{324}$ and his comparison of $\theta \mathrm{i}^{\text {III }}{ }^{\mathrm{O}} \mathrm{si}^{\text {III }}$ know $v t$ with 6i ${ }^{\mathrm{I}}$ 悉 sit $<*$＇səc everything n，know $v t$ is phonologically untenable．${ }^{325}$ With the morphological evidence in 7．1．3 showing a clear association with Old Burmese and Old Chinese，and the comparative sets throughout this work regularly concurring in their tonal categories，a Sino－Tibetan origin of tone II in $-?$ and III in $-s$ ，that may be projected back from Old Chinese，is likely．${ }^{326}$

| ST | $N C$ | $O B$ | $O C$ |
| :---: | :---: | :---: | :---: |
| ＊－$\varnothing$ | － | － | － |
| ＊－1 | $-^{11}$ | ${ }^{\text {II }}$ | ${ }_{-1}\left({ }^{1}{ }^{\text {² }}\right.$ ） |
| ＊－S | －III | $\left.-^{\text {III }}()^{3}\right)$ | .$^{\text {III }}\left(-^{s}\right)$ |

[^121]The split of Old Chinese tone I in Early-Mandarin, as discussed by Pulleyblank (1978a:192), and the split of Lolo-Burmese tone categories I and II in Lahu and Lisu, as discussed by Matisoff (1970:14), both came about due to different manner features of initials. There is no evidence for such a distinction in the bipartite division of tone category II in Mizo and Zahau.

Luce (1959a:28) suggests that tone IIa and tone I, excepting when an obstruent coda in Thado, Zo, Tedim and Sizang corresponds to an original $-r$, never occur with obstruent codas. Löffler (2002a:129) notes a general association of tone IIb with obstruent codas in Mizo, ${ }^{327}$ and Weidert (1975:11) attributes the few cases outside of IIb in Mizo to a mostly phonoaesthetic origin; Ostapirat (1998:235-7) similarly notes an association of tone II with obstruent codas in Tedim. Luce's data (1962a, 1985:II.84-7) also has no cases of tone IIb with final sonorants; there are actually numerous instances but they can generally be attributed to morphologically derived forms, discussed in 7.1, which are not recorded in Luce's word list. ${ }^{328}$ In closed syllables, this allows tone IIb to be limited to tone-bearing syllables with obstruent codas and to derived forms. Open syllables appear to be able to bear IIa or IIb but, although Luce (1962a, 1985:I.83;II.82) and Weidert (1979:80;90;114-5) do not treat open rhymes in IIa as aberrant, they both note an abundance with IIb. ${ }^{329}$ Cases of IIa in the correspondence sets like Blood (\#93), Thin (\#94) and itch (\#95) suggest them to be loanwords but further evidence may prove otherwise. A couple of possible other cases are the following:

## [\#80] Fruit

[M] *sej (1985:24)
[P\&S] *sej (1996:\#1496)
[NC] *t ${ }^{\text {¹ }} \mathrm{Ej}^{\mathrm{H}}$ fig, fruit $n$

[^122]In spite of previously rejecting the idea (1972b:279), Matisoff (1980:21) compares the final syllable -sill of star $n$; this is phonologically untenable. ${ }^{330}$
[OB] $\Theta \mathrm{i}^{\mathrm{II}} \mathfrak{0}$ : si $\mathrm{si}^{\mathrm{II}}$ fruit $n$
Shorto (2006:257) suggests a Mon-Khmer association.

## [\#81] Parrot

[M] *gjoj ${ }^{\text {II }}(1988 \mathrm{a}: 506)^{331}$
[P\&S] *k(h)ij (1996:\#2314)
[NC] *kil parrot $n$

The initial should be aspirated to regularly correspond with the Northern Chin form. The root is of very limited distribution in Tibeto-Burman such that Matisoff only reconstructs a Lolo-Burmese form although Luce (1985:II.95) does suggest some Karen comparanda. The inscriptional evidence shows Matisoff's Lolo-Burmese medial $-j$ - to be unnecessary. ${ }^{332}$

For native uninflected tone-bearing syllables the following correspondences may be suggested:

|  | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| open | $-^{\text {[b }}$ | ${ }^{\text {Ifb }}$ |  | ${ }^{\text {II }}$ |  |  |
| stop | $-^{\text {Fb }}$ | ${ }^{\text {Irb }}$ | ${ }^{\text {H }}$ | ${ }^{\prime \prime}$ | - ${ }^{\text {II }}$ | ${ }^{\text {IT}}$ |
| closed | $-^{\text {Ia }}$ | ${ }^{\text {H/a }}$ | ${ }^{\text {II }}$ | ${ }^{\text {II }}$ | ${ }^{\text {II }}$ | ${ }^{\text {If }}$ |

[^123]Weidert (1987:134) suggests that there may be an association in Sino-Tibetan between tone II on velar nasal codas and their hardening to obstruents. In spite of Matisoff's scepticism (1994a:257), this is, albeit inconsistently, borne out by the data here. Baxter (1992:324) notes a similar association in Old Chinese word families suggesting that it may result from a phonological confusion of $-\eta$ ? and $-k^{333}$ which is supported by the discussion in 7.1.3.1 regarding the association of Mizo and Zahau $\eta^{I b}$ with Tedim and Sizang $-k$ via $-\eta$ ?

Internally in Northern Chin there appear to be a few examples of such a correlation: * ${ }^{\mathrm{h}} \mathrm{l} \varepsilon \eta^{\mathrm{II}}$ and ${ } \mathrm{k}^{\mathrm{h}}$ lek ${ }^{\mathrm{n}}$ exchange $\nu t$ with later semantic specialisation in Thado as ${ }^{\mathrm{h}} 1 \varepsilon \eta^{11}$ substitute $v t$ and ${ }^{\text {h }}$ le? ${ }^{1 \mathrm{I}}$ exchange $v t$; the irregular Mizo and Zahau forms dig ${ }^{\mathrm{Ib}}$ straight $v i$ are undoubtedly related to dik correct, true $v i$; Mizo rik ${ }^{\mathrm{Ib}}-$ threaten $v t$ corresponds to Zahau -riy ${ }^{\mathrm{II} a}$ scare $v i$ while Thado and Zo make a presumably later semantic distinction between the two as giy ${ }^{11}$ scare $v i$ and gil ${ }^{11}$ threaten $v t{ }^{334}$ Mizo $\mathrm{t}^{\mathrm{h}}$ lig ${ }^{\mathrm{IIa}}$ and
 elbow, recoil (as gun) $v t$; Mizo kik knock $v t$ and Zahau kin ${ }^{\text {III }} \sim \mathrm{kig}^{\text {III }}$ knock $v t$. In the comparative sets the phenomenon appears to be generally restricted to Burmese. In addition to the cases of year $n$, discussed in 6.3, and Tree n (\#84) and Maggot (\#76), the following may be noted:

## [\#82] Stone

[M] *k-luk/y (2003:523-4)
[P\&S] *k-lia:y/k (1996:\#1922)

［OC］məy ${ }^{\text {III }}$ 夢 muwy ${ }^{\text {III }}<$＇$^{\text {＇məy }}{ }^{\text {III }}$ dream $n$
Although assigned a gerundive sense here，a verbal function for 夢，proposed by Takashima（2003：I．149），in his original translation of the following inscription seems justified in light of the syntax：

乙丑卜能貞甲子聞乙丑王夢牧薬不住禍隹又（BB 96）

[^125]> Yi Chou divination Nan test Jia Zi cleave ${ }^{341}$ Yi Chou king dream herd stone mi-deer not be misfortune be aid.
> Yi Chou day divination, Nan tests: When Jia Zi day cleaves Yi Chou day, the king's dreaming of herding stone mi-deer does not mean misfortune but means aid.
> This suggests that the nominal tone III reading is a derivation of an original verbal sense.

A somewhat more complicated case may be found in Matisoff＇s comparison
 tonologically more appropriate comparison is with naw̃ ${ }^{I} \varsigma \wp จ \mathcal{E}$ nwin $\eta^{\mathfrak{I}}$ hereafter $n$ but notably the Burmese word for naw？$\oint \oint>\infty$ nwik back $n$ ，from which is derived ənav？ ъ๘ฐวกో ənwik West $n$ ，shows the hardening associated with the tone II contour．

Sagart＇s suggestion（1999b：61－2）of a common，yet sporadic，${ }^{342}$ shift of $-\partial \eta^{I I}$ to $-\partial^{I I}$ in Old Chinese，which he attributes to the glottalic origin of tone II，is probably relevant here．The loss of a velar coda in Old Chinese before $-?$ ，corresponding to tone II，is discussed in the case of Lick（\＃13）and it may be assumed that a hardening of $-\partial \eta$ ？to $\partial k ?$ preceded the development to $-\partial^{H}$ as discussed under Ear（\＃88）．${ }^{343}$ This inherent but sporadic incompatibility of tone II with $-\eta$ is nicely paralleled in the discussion in 6.3 below showing a shift of $-j \partial m^{I I}$ to $-\partial \eta^{i t} /-\partial \eta^{I}$ in Old Chinese，

## 6．3．Northern Chin－I $\eta^{I I}$ and Old Chinese－onn

Pulleyblank（1991a：56－7）notes that xiesheng characters like $t^{h}$ ien $n^{\mathrm{I}}$ 天 then ${ }^{1}<{ }^{* h} 1 ə n^{\mathrm{I}}$ sky，heaven $n$ and $\mathrm{t}^{\mathrm{h}} \mathrm{inn}^{\mathrm{II}}$ 忝 $\mathrm{t}^{\mathrm{h}} \varepsilon \mathrm{m}^{\mathrm{II}}<*^{\mathrm{h}^{\mathrm{h}}}(\mathrm{j}) \geq \mathrm{m}^{\mathrm{II}}$ shame $v i$ suggest that $-m$ occasionally fronted to $-n$ ．Pulleyblank（1995a：178；182）assumes the cause of this to be a medial $-j$－

 Pulleyblank suggests the word may be a Chinese loan into Burmese after the shift of

[^126]the coda；this would help account for the tonal discrepancy as well，but the phonological regularity of the comparison and the evidence below suggest that an original Sino－Tibetan rhyme $-j \partial m^{I I}$ has occasionally palatalised to $-\partial n^{I}$ very early on causing a concomitant shift to tone I in Old Chinese：
［\＃84］Tree
［M］$\quad * \operatorname{sig} / \mathrm{k}(2003: 524)$
［P\＆S］＊sig（1996：\＃1513）
［NC］＊t＂In＂wood $n$
［OB］$\theta_{\mathrm{I}}$ ？ $20 \odot$ sac tree $n^{345}$

The evidence for an original bilabial coda stems from the oracle－bone form $\overline{\text { 设 }}$ of the xiesheng graph $6 \min ^{1}$ 新 $\sin ^{1}<*^{\prime} \operatorname{sen}{ }^{1}$ new $v i$ whose phonetic component $\not \ddagger$ represents $\operatorname{cin}^{1}$ 辛 $\sin ^{1}<*^{\prime} \sin ^{1}<{ }^{1} *^{\prime}$＇sjom ${ }^{1}$ bitter $v i$ which is reconstructed with an original bilabial coda under Liver（\＃85）．Miller（1974：208）rejects the comparison with the Chinese form on the semantic grounds that a meaning firewood $n$ is not attested in any of the proposed Tibeto－Burman comparanda； Matisoff（1975：167，1978a：174）counters that such a meaning is indeed found． Significantly，Peiros \＆Starostin（1996：\＃1511）cite an apparent phonological
 （2002a：137）appears to reject this mainly on the basis of limited distribution outside of Lolo－Burmese，but Matisoff（2003：345）notes a possible supporting form in Qiangic．

## ［\＃85］Liver

［M］$\quad * \sin (2003: 277 ; 306)$
［P\＆S］＊sin（1996：\＃1512）
［NC］${ }^{*}{ }^{h}{ }^{\mathrm{h}} \mathrm{In}^{111}$ liver $n$

[^127]The derived tone III is most likely a nominalised form of bitter vi in tone II． Weidert（1987：36）notes that Bodo－Garo has tone II contrasting with Chin and Naga tone III．
［OB］ $\mathrm{ii}^{\text {II }}$ 2య్తీ：saj ${ }^{\text {II }}$ liver $n$
The areal semantic association of liver $n$ and heart $n$ ，noted by Wilkins （1996：284），is supported in Burmese with Luce（1981：64）glossing it as liver， feelings $n$ and Stewart \＆Dunn（1940－81：358）as liver，seat of emotion，heart， mind $n$ ．

ఎబ్రీるં liver feel ATTR lord saintly PL to alms－flower serve continue in－order－to In order to continue to serve alms to the patient monks．${ }^{346}$
［OC］ $\sin ^{1}$ 辛 $\sin ^{1}<{ }^{*} \operatorname{sen}^{1}<{ }^{*}{ }^{\prime}$＇sjəm ${ }^{\text {II }}$ bitter $v i$
Evidence for a bilabial coda here is found in the xiesheng derivative in ${ }^{1}$ 音 ？ $\mathrm{im}^{\mathrm{I}}$ sound $n$ ．Matisoff＇s extension（2004：357－8）of the areal relationship between bile $n$ and bitter vi to liver $n$ suggests an entirely different semantic field from Burmese and Northern Chin．${ }^{347}$ The inscriptional form $\mp$ depicts some kind of pointed instrument suggesting that liver $n$ must be a derived sense，as suggested by tone III in Northern Chin，which then underwent further semantic permutations．

## 6．4．Tone II Nouns

A possible association of nouns with tone II when compared with their verbal counterparts was noted for Old Chinese in 3．3．2；a few possible cases in Old Burmese like flower $n$ and yoke $n$ are noted in 5．2．4．1 and 2．3．1．5 respectively．Although internal evidence in Northern Chin is even more limited，${ }^{348}$ recognition of this

[^128]morphological phenomenon possibly accounts for some mismatches of tones I and II in Sino-Tibetan:

## [\#86] Die

[M] *səj (2003:189;201)
[P\&S] *sij (1996:\#1508)
[ NC$] \quad{ }^{\mathrm{h} \mathrm{t}^{\mathrm{I}} \mathrm{I}}$ die $v i$
[OB] Өe1' $60 / \mathfrak{1} \mathfrak{s}$ sij ${ }^{1}$ die $v i$
[OC] $\mathrm{si}^{1 \mathrm{II}}$ 死 $\mathrm{si}^{\text {II }}<{ }^{*}{ }^{\prime} \mathrm{s} 2 \mathrm{j}^{11}$ die $v i$
See Schuessler (2007:47;478), and the discussion in 3.3.2, for the suggestion that tone II may have been used to reflect its inherently endoactive nature which is also associated with nominalisation. ${ }^{349}$

## [\#87] Fish

[M] *yja (2003:167)
[P\&S] *y(j)a (1996:\#2501)
[NC] ${ }^{*(11)} \mathrm{ya}^{\mathrm{II}}$ fish $n$
[OB] ya ${ }^{\text {II }}$ cl: $\mathfrak{y a}$ ail fish $n$
It is tempting to associate tã1 $1 a^{\mathrm{I}} \operatorname{coc}^{\mathrm{c}} \operatorname{tam}^{\mathrm{I}} \mathrm{ya}^{\mathrm{I}}$ fisherman $n$ which is attested in at least one case in the inscriptions with an aspirated second syllable as $\dot{o}^{\circ} \mathrm{c}$ l tam ${ }^{\text {rl }} \mathfrak{y} \mathrm{a}^{1}$ paralleling the alternation between Zahau $\mathrm{ya}^{\mathrm{nb}}$ and Mizo ${ }^{\mathrm{h}} \mathrm{y} \mathrm{a}^{\mathrm{rb}}$ :

0ंçl600038 (LK 95)
fisherman-star also come REAL
The star of dawn ${ }^{350}$ also comes.
However, in spite of the similarity, Hla Pe (1967a:86) treats it as a Mon loanword. Shafer (1965:5-6) suggests an association of the Northern Chin

[^129]forms with the Mon－Khmer velar stop initialled word for fish $n$ but this is unlikely as the form $\mathrm{ka}^{\text {III }} \infty \mathrm{ka}^{\text {III }}$ is maintained in many piscine loanwords from Mon listed in Hla Pe （1967a：88－9）．${ }^{351}$
［OC］ $\mathrm{y}^{\mathrm{lb}}$ 魚 $\mathrm{nia}^{\mathrm{I}}<{ }^{\mathrm{C}}{ }^{\prime} \mathrm{ya}^{\mathrm{I}}$ fishn
The oracle－bone graph ，representing $\mathrm{y}^{\mathrm{rb}}$ 魚 nia $^{\mathrm{I}}<$＊＇ya $^{1}$ fish $v i$ ，appears
 The following is a short but incontrovertible case due to it appearing after the negative 勿 which，following Takashima，in Takashima \＆Itō（1996：I．370－3）， only appears before controllable verbs：${ }^{352}$

王魚（BB 156．16）
King fish
The king（should）fish
勿魚（BB 156．15）
should－not fish
（The King）should not fish
It seems likely that the verbal form in tone I has ousted a nominal form in a tone II．
［\＃88］Ear
［M］$\quad{ }_{\mathrm{na}}(2003: 162 ; 176)$
［P\＆S］＊n2（1996：\＃521）
［NC］＊h na ${ }^{\text {I }}$ ear $n$
［OB］ $\mathrm{na}^{\mathrm{I}} \S>\mathrm{na}^{\mathrm{I}}$ listen $v t$

［OC］$\partial^{\text {II }}$ 耳 $\mathrm{nf} \mathrm{f}^{\text {II }}<$＊＇n $^{\text {nI }}$ ear $n$
貞疾耳隹㘳 $\frac{\star}{2}$（YZ 271）
Test ail ear is have mishap

[^130]Tested：An ailing ear means ${ }^{353}$ there will be mishaps．${ }^{354}$
The oracle－bone graph for ear $n$ is $\varangle$ ．The graphs $\dot{\sim}$ and $\mathbb{C}$ ，consisting of ear $n$ and one or two components for mouth $n \forall$ ，are generally treated as $\mathrm{t}^{\mathrm{h}} 1 \mathrm{~m}^{1}$ 耳徳 $^{\text {a }}$ $\mathrm{t}^{\mathrm{h}} \mathrm{kjy}{ }^{\mathrm{I}}$ listen but the graphic development is unclear and notably Takashima （2003：II．252－3）is non－committal．Qiu（2000：195－6）associates 聖，which is clearly derived from ${ }^{*}$ with $\mathrm{t}^{\mathrm{h}} \mathrm{y}^{1 \mathrm{I}}$ 王 dejy ${ }^{\mathrm{I}}$ as phonetic，and suggests that later textual confusion of 聖 and 聽 supports this．Qiu＇s argument can be reversed to suggest that 㯖 represents a semantic outgrowth of sage $n$ later in the history of language which is particularly likely as it would be curious for the scribes to omit the phonetic component if it really represented $\dot{\theta}$ ．It seems that the phonetic in was $\otimes$ simply $\varangle$ and the graph represented the now disused original verbal form still attested in Burmese．

## 貞王咡住禍（BB 358）

Test King hear is misfortune Tested：The King＇s hearing things ${ }^{355}$ means misfortune．${ }^{356}$

Alternatively，Sagart（1995b：346，1999b：61－2）suggests $-\partial \eta^{\text {II }}$ to be a dialectal feature of Old Chinese contrasting with a more general shift of $-\partial \eta^{I I}$ to $-\partial^{I I}$ which，on the basis of its $-\eta$ coda in the Jiyun and some Min dialects，he believes to have happened to 耳．Sagart＇s associated suggestion（1995b：346－7） that the Tibeto－Burman forms may be be the result of an Old Chinese loan remains a distinct possibility．

## 6．5 Loanwords and Tonal Discrepancies

Weidert（1987：115－34）lists some examples of Lolo－Burmese tones I and II being inverted in relation to other languages but，excluding the recourse of loanwords，is unable to provide any real solutions．Benedict（1972a：28－30；33）notes some similar cases with Old Chinese；in the case of Old Chinese tone I he falls back on a tentative

[^131]loanword hypothesis but for tone II cases he suggests conditioning environments based around a root-initial or prefixal $s$ - and an $-n$ suffix.

### 6.5.1 Benedict's $s$ - hypothesis

Benedict (1972b:29) notes that the case of Die (\#86) causes problems for his hypothesis. The only other words proposed by Benedict (1972b;33) that are relevant to the discussion here are Tree (\#84), Liver (\#85) and Fish (\#87) for which alternative accounts have been made. ${ }^{357}$ Consequently Matisoff's hesistancy (1999:25) in accepting Benedict's proposal seems well-founded.

### 6.5.2 Benedict's - $n$ Hypothesis

Here too Benedict (1972b:30) provides a counter-example to his hypothesis by suggesting the word for Dog (\#37) represents an inverse of his proposal. As it happens, dog may perhaps not reflect a nasal suffix, but to his examples under Bitter (\#1), Smoke (\#41), Water (\#56), Child (\#42) and also rodent $n$, discussed in 6.5.4, that have been dismissed previously as faulty comparisons, may be added the following comparison by Benedict which, in spite of its omission in his supporting evidence, also fits his hypothesis:
[\#89] Person
[M] $\quad{ }^{*}$ r-mi(j)-n (2003:449)
[P\&S] *mi (1996:\#101); *miən (ibid:\#87)
[NC] *mil person $n$
[OB] meril $\left(\mathrm{ma}^{\text {III }}\right) \stackrel{\theta}{\theta} / 80 \mathfrak{U}(\Delta) \mathrm{mij}^{1 \mathrm{I}}\left(\mathrm{ma}^{\text {III }}\right)$ woman $n$

[^132]
grandchild woman to give again REAL
It was further given to the granddaughter．${ }^{358}$
The latter morpheme $\theta \mathrm{ma}^{\text {III }}$ is a female suffix．${ }^{359}$ The modern Burmese spelling is now meĩ ${ }^{\text {II }}$ ma $^{\text {III }}{ }^{8} \mathscr{\&} \& \Delta$ with a superfluous－$n$ coda．${ }^{360}$
［OC］－
Contrary to Benedict＇s（1972a：158）comparison of the tonally discrepant min ${ }^{\text {1b }}$民 mjin＇＜＊＇mən ${ }^{1}$ people $n$ via a suffixal－$n$ ，Pulleyblank（1995a：178－9）and
 people $n$ which supports an original nasal coda．${ }^{361}$

## 6．5．3 Kinship Terms

The tonal alternation between Northern Chin ${ }^{*}$ pa $^{\text {II }}$ father $n$ and ${ }^{*}$ pa ${ }^{\text {III }}$ male $n$ correlates perfectly with＊nu ${ }^{\text {II }}$ mother $n$ and ${ }^{*}$ nu $^{\text {ti }}$ female $n .{ }^{362}$ On the basis of similar evidence in other Tibeto－Burman languages，Weidert（1987：51；166；213）suggests that a distinction between vocative and referential forms may have induced the tone shifts．${ }^{363}$ The former case has solid external comparanda suggestive of such a shift：

## ［\＃90］Father

［M］$\quad{ }^{*} \mathrm{p}{ }^{\mathrm{w}} \mathrm{a}(2000 \mathrm{a}: 153-5)$
［P\＆S］＊pa（1996：\＃233）；＊Pa（ibid：\＃330）；＊wa（ibid：\＃434）
［NC］＊pa ${ }^{\text {II }}$ father $n$

[^133]*pa ${ }^{\text {IIII }}$ male $n$
[OB] ba ${ }^{\text {III }} \curvearrowleft / \omega \mathrm{p}^{\mathrm{h}} \mathrm{a}^{\text {III }}$ father $n^{364}$
$\mathrm{p}^{\mathrm{h}} \mathrm{a}^{\text {III }} \odot \mathrm{p}^{\mathrm{h}} \mathrm{a}^{\text {III }}$ male suffix $n$

mother type father type 7 connect 7 generations on the mother's side and on the father's side. ${ }^{365}$

Weidert $(1987: 51 ; 166)$ suggests that Burmese tone III is morpho-semantically conditioned as a vocative form instead of a referential one.
[OC] fu'I ${ }^{\text {II }}$ 父 bua ${ }^{\text {II }}<$ ''ba $^{\text {II }}$ father $n$
fu ${ }^{11}$ 父 puan $^{11}<$ *' $^{11}{ }^{11}$ honorific suffix

Weidert (1987:337-8) suggests a similar tone shift between I and II may have occurred in the case of grandmother $n$ :
[\#91] Grandmother
[M] ${ }^{*} p^{w}$ әj (2000a:171-2)
[P\&S] *pij (1996:\#194;450)
[NC] *pil grandmother $n^{366}$

In the following inscription, Pe Maung Tin \& Luce (1963:64) gloss this as great-grandparent(s) $n$ but Luce's later suggestion (1981:13) of grandmother $n^{367}$ is supported by the word appearing to be compounded with grandfather $n$ in the same way as mother and father:

I wife mother father grandmother grandfather My wife's mother, father, grandmother, grandfather... ${ }^{368}$

[^134]［OC］ $\mathrm{pi}^{\mathrm{il}}$ 妣 $\mathrm{pji}^{1 \mathrm{I}}<{ }^{*}{ }^{\mathrm{p}}{ }^{\text {jil }}$ deceased mother $n$

This appears equally applicable to grandfather $n$ ：

## ［\＃92］Grandfather

［M］${ }^{*}{ }^{\text {w}}$ әw（2000a：167－8）
［P\＆S］＊po（1996：\＃310）；＊Ph $\partial \mathrm{w}$（1996：\＃429）
［NC］${ }^{*}{ }^{1}{ }^{1}$ grandfather $n$
［OB］ $\mathrm{p}^{\mathrm{h}} \mathrm{ov}^{\mathrm{I}} \stackrel{Q}{q} \mathrm{p}^{\mathrm{h}} \mathrm{i} \mathrm{w}^{\mathrm{I}}$ masculine suffix $n$

Zalikumar Kahnazin grandfather ancestor haunch on stay．．． Jälikumāra and Kaṇhäjina rest on the haunches of their grandfather ${ }^{369} \ldots$

Recognition of such tonal shifts allows an account to be made for Matisoff＇s
 the tone II form is still attested in Bradley＇s comparison（1979：312－3）of Өəmil $2068:$ səmi ${ }^{\text {II }}$ daughter $n$ in which the first syllable is a reduced form of $\theta \mathrm{a}^{\mathrm{II}} 200: \mathrm{sa}^{\mathrm{II}}$ child $n$ allowing a literal gloss of female child $n$ as proposed by Pe Maung Tin \＆Luce $(1963: 113) .{ }^{370}$

## 6．5．4 Loanwords

Excluding faulty comparisons，the attribution of the remainder of tonologically irregular comparisons to loanwords appears to be correct．Included in the list below

[^135]are also cases where the tones happen to coincide but irregular segmental correspondences support an external origin. Following Miller (1988:527-9), the Tibeto-Burman numerals from two to nine are treated as Chinese loanwords; this is supported by their irregular segmental correspondences within Northern Chin as well as in their comparison with Old Burmese and Old Chinese. ${ }^{371}$ In a similar manner to the prefix-runs in Tibeto-Burman numerals noted by Matisoff (1997:100-2), tonebearing syllables, excluding diphthongs and those with secondarily derived tone IIb with obstruent codas, have all undergone analogical levelling to tone I in Northern Chin and tone II in Burmese; Northern Chin form 2 derivations have also been analogically levelled. Three other comparative sets, Blood (\#93), Thin (\#94), Fruit (\#80) and Fall (\#8) that suggest loanword influence are not noted below due to their individual treatments elsewhere.

[^136]| Gloss | NC | OB | OC | Source | Reference |

| :---: | :---: | :---: | :---: | :---: | :---: |

${ }^{417}$ Sagart（1999b：202）follows Gong（1980：472）in assuming that the lack of labialisation in Old Chinese need not preclude a direct comparison with Tibeto－Burman but Gong＇s two supporting examples have bilabial initials which account for the rounding．
${ }^{418}$ This is restricted to Zahau．Matisoff（2003：400）suggests that Mizo se－kor ${ }^{\text {Ta }}$ ，reflected in Thado，Zo and Tedim with a lateral coda－$l$ ，may be an Indo－Aryan loanword． Luce（1959a：23，1985：I．85）tentatively suggests that the first syllable in Sizang si＂${ }^{\text {h}}{ }^{h} \mathbf{u}^{\text {II }}$ horse $n$ may be Mon－Khmer in origin；it may alternatively be a loanword variant of the animal prefix．
${ }^{419}$ Note also the Yunjing reading lat．
${ }^{420}$ Benedict（1967：304）rejects the loanword association due to the semantic difference between Northern Chin fruit $n$ and Old Chinese coarse grain $n$ ．
${ }^{421}$ Duroiselle（1919：28－9）lists a plethora of variant inscriptional spellings often ending with－of $-t$ showing that the Written Burmese $\delta-c$ coda was a result of secondary palatalisation；the Old Burmese reconstruction here follows Nishi（1974：18）．

422 Matisoff (1988a:1141, 2000d:223) also notes the Burmese form to correlate poorly with Lahu.
${ }^{423}$ Matisoff (1997a:85) believes that the ${ }^{*}{ }_{r}$ - initial results from an original nasal undergoing rhotac Old Chinese appears to have been reanalysed as a sibilant -s perhaps via analogy with two vi.
 five fingers of the hand collectively such that when combined with the second morpheme, meaning two $v i$, it may literally mean five and two vi . He tentatively compares it
 to be a compound of six and two that is most likely the source of the reduced modern form.
${ }^{425}$ Matisoff (1997a:83) attributes the $-p$ coda in Thado rup to assimilation of the velar to the preceding rounded vowel. Similar cases may be found in Thado lop colugo $n$
${ }^{426}$ The source is obscure but in addition to the tonal discrepancy, Old Burmese, as reconstructed by Luce (1985:III.125), can only support a medial $-j$ - rather than $-r$-.
${ }^{428}$ Benedict (1994:3-4) suggests the loan is from Sino-Tibetan to Austroasiatic but Matisoff's observation (2003:300) of its rarity in Sino-Tibetan suggests the inverse to

${ }^{429}$ Sagart (1999b:149-52) provides good evidence for a lateral initial in this word.

| :--- | :--- | :--- | :--- | :--- |

${ }^{443}$ The Vietnamese correlate noted in Fowler (1988:45) is tentatively linked by Shorto (2006:494) to a Mon-Khmer source which supports Schuessler's Austroasiatic associations for this word.

## Chapter 7: Northern Chin Morphology

Northern Chin words may be classified as either nouns or verbs. Following Osburne (1975:120), this classification also includes the numerals which for the numbers one through nine may be classified as intransitive verbs on the basis of their, albeit analogically conditioned irregular, inflections in Mizo, Zahau and Thado.

### 7.1 Verbal Inflections

Most Northern Chin verbs have a basic form 1 and an inflected form 2; specific syntactic functions vary between languages. ${ }^{444}$ The main form 2 derivations of the six languages from a reconstructed Northern Chin base, of which the $-s$ suffix will be discussed further below, may be summarised accordingly: ${ }^{445}$

| NC | Mizo | Zahau | Thado | Zo | Tedim | Sizang |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| *-k-s | -? | -? | $-\varnothing^{\text {III }}$ | $-\emptyset^{\prime \prime \prime}$ | -? | - $\varnothing^{\text {III }}$ |
| *- $k^{\prime \prime}$ - $s$ | -? | -? | $-\emptyset^{\text {III }}$ | - $\nabla^{\text {III }}$ | $-k^{\text {III }} /-$ ? | $-k^{\text {III }} /-\nabla^{\text {III }}$ |
| *- $k^{\text {III }}$-s | -? | -? | $-\emptyset^{\text {II }}$ | $-\varnothing^{\text {III }}$ | -1 | $-\emptyset^{\text {III }}$ |
| *-t-s | -? | -? | $\emptyset^{\text {II }}$ | $-\nabla^{\text {III }}$ | -? | $-\emptyset^{\text {III }}$ |

| *- $w^{\text {III }}$-s | $-w ?$ | $-w ?$ | $-w^{\text {III }}$ | $-w^{\text {III }}$ | $-w ?$ | $-w^{\text {III }}$ |

[^143]Mizo and Zahau form 2 derivations in tone $\Pi \mathrm{Ib}$ may not assign syllable weight to the vowel; there are a handful of exceptions in the word list but their occasional freevariation with regular forms, irregular correspondence across all the languages or loanword status shows this not to be of reconstructional significance. Open syllables with diphthongs develop tone $I(\mathrm{~b})$ in form 2 regardless of the original tone due to their patterning as syllables with surface vowel length before obstruent codas that, as discussed in 3.4 and 6.1, have an inherent association with tone II.

### 7.1.1 Stopped Syllable Variation in Tedim and Sizang

The alternative Sizang reflexes of ${ }^{*}-k^{I},{ }^{*}-t^{I I},{ }^{*}-p^{\text {II }}$ and ${ }^{*}-r^{1 I}$, due to its occlusion to $-k^{446}$ are in free-variation; in Tedim they are only in free-variation after the diphthongs $I a$ and $v a$ otherwise only the former surfaces. ${ }^{447}$ It appears that the former variants in tone III represent the earlier state of affairs that is gradually shifting to a complete loss of the original coda. Significantly, Osburne (1975:140) notes a similar variation in a few verbs in Zahau where ${ }^{*}-k^{I \prime},-t^{I I},-p^{I I}$ give either ${ }^{*}-k^{I I I},-t^{I I I},-p^{\text {II }}$ or -1 although only reflexes in $-?$ exist in the Zahau recorded here. ${ }^{448}$

### 7.1.2 Open Syllable Variation in tone II

The general form 2 reflex is $-k$ and is derived from regular syllables corresponding to tone IIb in Mizo and Zahau. Like the grammatically conditioned tonal splits in certain Lolo-Burmese languages, noted by Burling (1967:57) and Matisoff (1978b:19-20;33), Mizo regularly shifts all verbs with open rhymes from tone IIb to tone III; this does not affect the form 2 inflections. Any nominal forms associated with form 1 retain the original tone such that Mizo $\mathrm{k}^{\mathrm{h}} \mathrm{u}^{\text {Il }}$ smoke $n$ correlates with $\mathrm{k}^{\mathrm{h}} \mathrm{u}^{\text {I11 }}\left(<*^{\mathrm{h}} \mathrm{u}^{\text {Il }}\right)$ smoke vi. The shift to tone III in verbs renders Hillard (1975:12;16-9) unable to separate when Mizo $-k$ develops from original tone III, and when $-k^{\text {Ihb }}$ develops from secondarily derived tone $\mathrm{III} .{ }^{449}$ Cases with $-t$ appear in words corresponding to irregular open

[^144]syllables in IIa discussed in 6.1. The suggestion that such words belong to a more recent layer is supported by Zahau syllables in -i, that are shown in 1.4.2.2 to have developed from -oj after coronal initials, always developing form 2 inflections in -it ${ }^{\text {rb }}$ regardless of tone. Occassional occurrences of $-t$ instead of $-k$ from IIb are most likely further analogical extensions of the $-t /-k$ alternations discussed in 7.2.2 and attributed to mutual influence between languages. ${ }^{450}$ Further tentative support for words in IIa being external in origin, but possibly of an old stratum due to regular tonal correspondences, may be found in the following comparative sets:
[\#93] Blood
[M] $\quad{ }_{\text {s-hjw }}$ j-t $(2003: 194 ; 230)$
[P\&S] *s- ${ }^{\text {witj }}$ (1996:\#2017)
[NC] *thil blood $n$
In Mizo and Zahau this may be used as a verb bleed $v i$ in which Matisoff's - $t$ suffix derives from an $-s$ suffix in form $2 *^{h^{h}} \mathrm{t}^{11}\left(<*^{1 \mathrm{l}} \mathrm{i}^{1(\mathrm{n}(\mathrm{a})}-\mathrm{s}\right)$. Excepting Zahau, $-u j$ would be expected instead of $-i$. Benedict (1972:51) reconstructs *hjw- to account for this.
[OB] Өwer ${ }^{\text {II }}$ ©

Sagart (1999a:171-3, 1999b:153) reconstructs the initial as ${ }^{* h} m$ - on the basis of correspondences with words like mic $\varepsilon^{[1]}$ 戳 met $<*^{*} \operatorname{moc}$ blood $n$. The derivation of $-\partial c$ from an original $-\partial k^{j}$ allows for an analysis of the rhyme as $-a j$ with a suffixal $-k$. Starostin (1995:228) assumes a suffixal origin, but Sagart (1999a:174-7) suggests the velar coda to be evidence that this is a Chinese loan into Tibeto-Burman. The tone IIa contour in Mizo and Zahau combined with the lack of labialisation in Northern Chin supports the idea of

[^145]an external source, particularly in light of the original bilabial initial in Old Chinese that is not attested in Tibeto-Burman. Sagart (1999a:175) compares this development to $\prod^{\text {IIII }}$ 日 nit $<*$ 'nəc sun, day $n$ which he also treats as a Chinese loan. A difficulty with this is that while Sagart's proposal that $i k>i c$ $>i j 1\left(a k^{j}>\partial c>a j 2\right.$ in the reconstruction used here) is promising in light of the tone II reflex in blood $n$, the Tibeto-Burman correlates of sun, day $n$ are in tone I. An alternative proposal for the development of sun, day $n$ is discussed under Sun (\#40).

## [\#94] Thin

[M] *pa-n/t $>$ *ba-n/t (2003:440)
[P\&S] *pa: (1996:\#178)
[NC] *pa ${ }^{\text {II }}$ thin $v i$
Matisoff's ${ }^{*}-t$ suffix in the form $2{ }^{*}$ pat $^{11}\left(<{ }^{*} \mathrm{pa}^{\mathrm{II}(\mathrm{a})}-\mathrm{s}\right)$ derives from an $-s$ suffix. The word is not attested in Mizo and appears to be vying for lexical dominance with ${ }^{*} \mathrm{pen}^{1 / I I}$ thin $v i$ in the other languages. In Thado and Sizang the form with an $-n$ coda appears to have been semantically specialised as very thin $v i$; according to Henderson (1965:156) and Bhaskararao (1996:78), this may also be extended to Tedim. ${ }^{452}$ Table B in Luce (1962a) includes both the open and closed syllables under the same category; the tone IIa in Zahau for the former and the variation between tones I and II in the latter suggests the possibility of external influence.
[B] $\mathrm{pa}^{\mathrm{II}} \mathcal{O}$ ): $\mathrm{pa}^{\mathrm{II}}$ thin $v i$

## [\#95] Itch

[M] *ja (2003:136)
[P\&S] *ja itch (1996:\#1414)
$[\mathrm{NC}]{ }^{*} \mathrm{ja}^{\mathrm{II}(\mathrm{a})}$ itch $v i$

[^146]The irregular vocalism in Tedim $z i a^{\text {II }}$ and Sizang ze ${ }^{\text {II }}$ possibly reflects a loan source.
[B] ja ${ }^{\mathrm{II}}$ ws: ja" itch $v i$

### 7.1.3 Origin in Suffixal -s

Although noting a general change to tone III in form 2, the variety of form 2 reflexes leads Weidert (1979:98-107) to reconstruct a suffixal combination -( $s$-) $d^{h}$ whereby the dentalisation triggered by the $-d^{h}$ suffix could be modified by glottalisation caused by the $-s$ - infix. Matisoff (1982:9-17) criticises Weidert's proposal for being typologically bizarre and phonetically aberrant; preferring to opt out of any allinclusive hypothesis, he proposes three separate suffixes $-s,-t$, and $-k$ to which he can identify no semantic function nor account for the selection of one over another. Ostapirat (1998:244-6) makes the interesting suggestion that in Tedim there is a tenselax alternation such that syllables in tone II (tense) give tone III (lax) but syllables in tone III (lax) give -? (tense) but then admits that this leaves no account for the derived forms with $-t$ and $-k$. In spite of his suggestion that the alternation between form 1 and form 2 is not directly phonologically conditioned (1974:78) and, specifically in reference to Mizo, is largely irregular (1975:1), Hillard (1975:12) suggests an inverse proposal that Mizo form 1 open-rhymes may actually be derived from their form 2 counterparts which retain etymological $-t$ and $-k$ suffixes, but notes (1975:9) that the lack of a $-p$ coda in this analysis is a problem. Significantly Hillard does note a correlation between tones and $-t$ versus $-k$ suffixes (1975:10) but prefers to assume that the different tonal contours were triggered by the different status of the codas before they were lost. Noting a similar correlation, Löffler (2002b), in essentially a reversion of Hillard's proposal back to a more plausible derivation of form 2 from form 1, believes that all the verbal paradigms may be derived from a single suffix. He tentatively suggests this may be something like $-t$ which may also surface as $-k$ in open syllables depending on the tone contour (2002b:124) or as a glottal stop in closed syllables that would either replace obstruent codas or, in the case of sonorant codas, would either disappear to leave a distinctive tonal reflex or remain as a coarticulation depending on the tone of the syllable and manner of articulation of the
coda (2002b:130). ${ }^{453}$ Löffler succeeds in identifying most of the main derivational patterns outlined above but the phonological development of his $-t$ coda is rather arbitrary. Significantly Löffler (2002a:128), following his own proposals cited in Henderson (1976:16), notes that the Tibetan equivalent of his final $-t$ appears to be final $-s$, but excludes this from consideration on the basis that Northern Chin root final $-s$ becomes $-?$ as discussed in 5.2.7. A possible association with the Tibetan $-s$ suffix is proposed in Pulleyblank (1966b:423); Henderson (1976:7;9) takes up this proposal and suggests a further possible comparison (1976:11) to the Old Chinese tone III derivations. Unfortunately Henderson is unable to take the comparison out of the realms of speculation but her hunch seems to be correct when the different conditioning environments are taken into account. Excluding the general association of $-s$ with tone III as attested in Old Burmese and Old Chinese, and the loss of original stop codas before $-s$ which is noted in 3.2.3 to also occur in Old Chinese, the following developments remain to be discussed:

### 7.1.3.1 Glottality

An association of $-s$ with glottality in the development of tone III in Old Burmese and Old Chinese is noted in 2.4.1; this renders its development here under the conditioning environments noted above phonologically possible. The association of root final $-s$ with glottality, discussed in 5.2.7, may also be noted here. The attestation of glottalised nasals in Lai Chin where Mizo and Zahau have nasals in tone IIb corresponding to obstruents in Thado, Zo, Tedim and Sizang suggests a glottalic development here also that parallels the glottalised liquids and glides in Lai Chin that are still maintained in Mizo, Zahau and Tedim. The typological naturalness of a development of $-p / t / k$ from $-m ? /-n 2 /-\eta$ ? is noted in Matisoff (1982:49) as well as in 6.2. The alternative emergence of tone IIb after nasals in Mizo and Zahau is suggestive of the glottalic origin of tone II; this is supported by the occasional occurrence of laterals and glides in tone IIb that tend to be in free-variation with their glottalised counterparts such that they are of no reconstructional significance. ${ }^{454}$ The further

[^147]development of $-\eta$ ? to Mizo $-n^{116}$ and Tedim $-t$ appears to be the result of the spreading of the coronal feature of suffixal $-s .{ }^{455}$

### 7.1.3.2 Open syllables and $-t /-k$

Matisoff (2003:431) shows the development of $-s$ into $-t$ to be a regular development in Tibeto-Burman; it is also noted in footnote 326 to have occurred sporadically in Old Chinese. A development of $-s$ into $-k$ is less well-supported cross-linguistically but the shift of $-r$ to $-k$ in certain Northern Chin languages, discussed in 5.2.4.1, via an intermediary uvular or velar fricative articulation, discussed in 4.3, certainly makes such a change less typologically unreasonable when the close relationship of $-s$ with the laryngeal fricative $-h$, to be discussed below, is taken into account.

### 7.1.4 Superadded-s Suffixation

An issue with the $-s$ hypothesis is that words in tone III which were originally derived from suffixal $-s$ are allowed to further inflect as if they were suffixed again. Pulleyblank (1966b:423) suggests the complexity of the inflectional system may be due to analogical extension affecting different layers of language; in the case of derived words from an original tone III this seems to indeed have been the case. However, if a form 2 derivation could be lexically reanalysed in form 1 and inflected again, the $-s$ suffix that triggered the first inflection must have developed into something else before $-s$ could be suffixed again. This calls into question how $-s$ suffixation could still exist as a formative process if there was no trace of suffixal $-s$ left in the lexicon.

A solution to this lies in the development of $s s$ in Old Chinese. Pulleyblank (1973b:371, 1978a:173-4) observes that the development of $-s$ into a laryngeal fricative $-h$ by the time of the Qieyun was a sporadic process that affected some rhymes earlier than others. In support of this diglossic situation, Pulleyblank (1978a:200) notes a similarity with Henderson's observation (1952:169-70) that the

[^148]Cambodian final sibilant $-s$ is not distinguished from final aspiration $-h$ except in careful reading pronunciation. The most likely scenario in Northern Chin is that $-s$ gradually started to shift to $-h$ in some words which were then open to further suffixation by the lexically still viable $-s$ remaining in other words. By the time all cases of $-s$ had shifted to $-h$, the pattern was already set such that analogy was allowed to take over to derive the rest of the lexicon. A clear example of this distinction in suffixal levels, and the effect of analogy thereon, may be found in words of the type $-\eta^{\text {II }}$ which should all be attested as $-n^{I I I}$ if derived from an original $-\eta^{1 / I I}$ with suffixal -s causing coronalisation of velar. The situation is similar to that of $\eta^{I I I}-s$ becoming $-n^{\text {Ib }}$ or $-t$ in Mizo or Tedim respectively but $-\eta^{\mu b},-k$ or $-?$ in Zahau, Sizang or Thado/Zo respectively. ${ }^{456}$

### 7.1.5 Causativity Paradigms

The cases of superadded $-s$ suffixation tend to mark an interesting process of causativisation in Northern Chin. Henderson (1965:83) shows a few examples of Tedim paradigms whereby form 2 inflections of intransitive verbs may be used as transitive verbs in form 1 while the form 2 inflections of transitive verbs may be used as benefactive verbs in form 1 which may also manifest a distinct form 2 . The general loss of the intermediate stage in Mizo and Zahau, as well as in Lai, such that only the form 2 inflection of the derived form 1 remains, has led Osburne (1975:114), Peterson (1998:93-4) and Matisoff (2003:472-3) to suggest a distinctive form 3 inflection. ${ }^{457}$ That these isolated Mizo, Zahau and Lai third forms are rather simply evidence of the gradual reduction in verbal inflections, that Hartmann (2002:81) shows has already occurred on a massive scale in Southern Chin languages, is hinted at by Hillard (1974:82-3) who compares Henderson's Tedim paradigms and some Mizo paradigms in Bright (1957b:110) to suggest that they may represent a similar process but is unable to take the comparison further. ${ }^{458}$ The loss of the derived form 1 in Zahau may be seen in a comparison of the Zahau and Thado reflexes of ${ }^{*}$ klon $^{\text {II }}$ arrive $\nu$ below:

[^149]|  | Form 1 |  | Form 2 |  | Form 1 |  | Form 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Zahau | $t^{\prime}$ '0y ${ }^{\text {II }}$ | $\sim$ | $\mathrm{t}^{1} \mathrm{mn}{ }^{\text {III }}$ | return $v^{459}$ | - |  | $t^{1} \mathrm{~m}^{\text {Ib }}$ | return vt |
| Thado | ${ }^{\text {b }} \mathrm{log}{ }^{\text {II }}$ | $\sim$ | ${ }^{\text {h }}$ lon ${ }^{\text {III }}$ | arrive vi | ${ }^{\text {h }} 10 \mathrm{n}{ }^{\text {III }}$ | $\sim$ | ${ }^{\text {n lot }}$ | bring vt |

The ascendancy of benefactive and causative particles in Northern Chin ${ }^{460}$ seems to have been a major contributor in the reduction of verbal forms such that evidence of these paradigms is now sporadic. Inspite of the better rentention of the intermediate derived from 1 in Thado, Zo, Tedim and Sizang, examples of such causativity paradigms are rare and the best evidence comes mainly from Zahau and sometimes Mizo. Significantly, there do still remain a few examples where Mizo and Zahau maintain the full paradigm as well as cases where Thado, Zo, Tedim and Sizang lose the derived form 1 .

There are also several cases where the form 2 of the derived transitive or benefactive form 1 is not attested. In some cases this can be attributed to phonological convergence preventing verbs from inflecting any further: Thado, Zo and Sizang have ${ }_{-}{ }^{\text {III }}$ where Mizo, Zahau and Tedim distinguish $-?$ and $-{ }^{\text {III }}$ such that Zo kvej ${ }^{\text {III }}$ bend $v t$ is the regular phonological correlate of both Tedim form 1 koajil ${ }^{\text {iII }}$ and form 2 kvaj? bend $v t$; the form 1 codas $-p,-t,-k$ universally become $-?$ in in Mizo and Zahau form 2 inflections ${ }^{461}$ but are sometimes retained in Thado, Zo, Tedim and Sizang ${ }^{462}$ such that the nominal derivative $\mathrm{p}^{\mathrm{h}} \mathrm{ie}^{\text {III }}$ ( $<{ }^{*} \mathrm{p}^{\mathrm{h}} \mathrm{rat}^{\mathrm{H}}-\mathrm{s}$ ) broom $n$ of Sizang $\mathrm{p}^{\mathrm{h}} \mathrm{iet}^{\text {II }} \sim \mathrm{p}^{\mathrm{h}} \mathrm{iet}^{\text {III }}$ sweep $\nu t$ is not distinguished in Mizo $p^{h^{h}} \mathfrak{r a}$ ? broom $n$ from the form 2 in $p^{\mathrm{h}} \mathrm{rat}^{\mathrm{rb}} \sim \mathrm{p}^{\mathrm{h}}$ a? sweep $v t .^{463}$ Sizang has a variant form $2 \mathrm{p}^{\mathrm{h}} \mathrm{e}^{\mathrm{III}}$ which is homophonous with broom $n$ but the word for broom $n$ is fixed and cannot be attested as $\mathrm{p}^{\mathrm{h}} \mathrm{iet}^{111} ;{ }^{464}$ in purely verbal terms, this may be compared to Mizo ts ${ }^{\mathrm{h}} \mathrm{ok}^{\mathrm{nb}} \sim$ ts $^{\mathrm{h}} \mathbf{v a}$ ? emerge $v i$, ts ${ }^{\mathrm{h}} \mathbf{v a}$ ? produce $v t$ and Sizang suek $^{11} \sim$ suek $^{\text {III }} /$ sue $^{\text {III }}$ emerge vi, sue ${ }^{\text {III }}$ produce, unload $v t$ which similarly does not show the variation in the transitive form. The situation supports the discussion in 7.1.1

[^150]where it is suggested that the variants with the obstruent codas and tone III represent the earlier state of affairs. ${ }^{465}$

The table lists all the verbs, excluding cases also attesting variations in initial aspiration to be discussed in 7.3, in the word list for which grammatically distinguishable causativity paradigms are still extant. Cases like Zahau *na ${ }^{1} \sim{ }^{*}$ net hurt vi and *net hurt vt, where the possible form 2 of the derived transitive or benefactive form 1 is not attested, are not noted here due to their playing no role in morphological distinctions. ${ }^{466}$ It should be noted that in cases where no intermediary form 1 is listed the form 2 occurs undifferentiated in form 1 . There is also a notable preponderance of verbs in form 1 with sonorant codas.

[^153]
### 7.2 Superficial Irregularities

### 7.2.1. Reduction of Causativity Paradigms

The ousting of original secondarily derived form 1 inflections by their form 2 counterparts in Mizo and Zahau provides clues towards the source of verbal inflections that appear not to fit the above correspondences. Almost all of these inflections are phonological relics, sometimes as alternative forms, of these further inflections that have now lost their distinctive function. In some cases comparative evidence maintains the grammatical distinction.

## a. Mizo

| naj ${ }^{\text {I }}$ <br> $\mathrm{sem}^{11}$ | $-\quad \text { / yej }$ | love, listen vt | (Zahau $\mathrm{yaj}^{\text {j }} \sim$ yaj $^{\text {III }}$ love $v t$ ) |

## g. Northern Chin:

Occasionally every language reflects the same $v b / t$ derivation that has ousted the original form 2 from which it was derived:

[^155]
### 7.2.2. Alternations of -k and -t

Zo and Sizang occassionally reflect $-t$ instead of $-k$ or -1 respectively in their derivations of $\eta^{\mathrm{mI}}-s>-\eta$ ? $>-k(>-$ ). In most cases the two are in free-variation; the explanation lies in the dominance of Tedim, discussed in 1.2 , whose shift of $-\eta^{\mu I I}-s>-$ $n ?>-t$ appears to have been adopted by Thado and Sizang in some items. The following cases are noted in the data set:
a. Zo:

| On ${ }^{\text {III }}$ | ~ | o? | 1 | ot | shout vi |
| :---: | :---: | :---: | :---: | :---: | :---: |
| voy ${ }^{\text {III }}$ | $\sim$ | - | 1 | oot | boast, exaggerate vi |
| don ${ }^{\text {III }}$ | $\sim$ | do? | 1 | dot | reply $v t$ |
| $p^{\text {h }}$ ¢ $y^{\text {III }}$ | $\sim$ | $\mathrm{p}^{\text {ho }}$ ? | 1 | $\mathrm{p}^{\mathrm{h}}$ )t | arise vt |
| tig ${ }^{\text {III }}$ | $\sim$ | ty? | 1 | tyt | wise vi |
| zey ${ }^{\text {III }}$ | $\sim$ | ze? | 1 | zet | use vt |
| hig ${ }^{111}$ | $\sim$ | - | 1 | hit | ferment vi |

b. Sizang:

| ben ${ }^{\text {III }}$ | $\sim$ | bek | 1 | bet | clap vt |
| :---: | :---: | :---: | :---: | :---: | :---: |
| don ${ }^{\text {III }}$ | $\sim$ | dok | 1 | dot | reply vt |
| ney ${ }^{\text {III }}$ | ~ | nek | 1 | net | ill, sluggish vi |
| $\mathrm{p}^{\mathrm{b}}$ Of $\mathrm{g}^{\text {III }}$ | $\sim$ | $\mathrm{p}^{\mathrm{h}} \mathrm{ok}$ | 1 | $\mathrm{p}^{\text {h }}$ )t | arise vt |
| zey ${ }^{\text {III }}$ | $\sim$ | zek | 1 | zet | use vt |
| kan ${ }^{\text {III }}$ | $\sim$ | - | 1 | ket | scorch vi |
| leg ${ }^{\text {III }}$ | $\sim$ | lek | 1 | lat | appear vi |

Sizang makes a secondary semantic distinction in the last example of ney ${ }^{111} \sim$ nek sluggish $v i$ and ney ${ }^{\text {iII }} \sim$ net ill vi. The use of $-t$ and $-k$ variation to make a secondary semantic distinction in Sizang is also noted in $\mathfrak{\eta a t}{ }^{\text {II }} \sim \mathfrak{y a t}^{\text {III }} / \mathrm{ya}^{\text {III }}$ tight $v i$ and $\mathfrak{y a k}{ }^{\text {II }} \sim$ $\mathrm{yak}^{\text {III }} / \mathrm{ya}^{\text {II }}$ tighten $v t$; Stern (1963:245) notes a similar distinction in the form 2 of ta $^{\text {II }}$ $\sim \operatorname{tat}^{\mathrm{II}} / \operatorname{tak}^{\mathrm{II}}$ scare $v i$ which he treats as tat ${ }^{\mathrm{II}}$ fear $v i$ and $\operatorname{tak}^{11}$ fear $v t$ but this is not supported in the Sizang recorded here. Occasional variation of $-t$ and $-k$ was noted in 7.1.2 where it was suggested to be isolated and not of reconstructional significance. ${ }^{482}$

[^156]
### 7.2.3 Alternation of -0 ? $/-o^{\text {III }}$ and $-o w ? /-0 w^{\text {III }}$

The following six entries in the wordlist have developed form 2 reflexes in -0 in Mizo, Zahau and Tedim or $-o^{\text {III }}$ in Thado, Zo and Sizang: * $\mathrm{t}^{\mathrm{h}} \mathrm{D} \mathrm{w}^{\text {il }}$ arise $v$; ${ }^{*} \mathrm{low}$ pick (flowers/fruit) $v t ;$ *jow $^{\mathrm{II}}$ finish, win $v t ;$ *tsow $^{\mathrm{II}}$ dig $v t ;$ * $^{\mathrm{h}} \mathrm{l} \mathrm{l} w^{\mathrm{II}}$ weed $v t$. The expected form 2 reflex would be $-จ w^{\text {III }}$ which even if ousted by a further derived form would be reflected as $-\diamond w$ ? in Mizo, Zahau and Tedim or still as $-\supset w^{I I I}$ in Thado, Zo and Tedim. Some words with the rhyme $-\partial w /$-ow have developed form 2 reflexes in $-\partial$ ? in Mizo, Zahau and Tedim or $-o^{I I I}$ in Thado, Zo and Sizang instead of the regular derivation of $\iota w$ ? or $-\frown w^{\text {III }}$ respectively. Weidert's failure to acknowledge the discrepancy (1979:100), and Löffler's observation that this does not occur in the Southern Chin language Maraa (2002b:132-3), suggests that the distinction must have been a subtle one. Of note is a similar confusion in the case of ${ }^{\text {ro }}{ }^{\mathrm{I}} d r y v$ for which Mizo and Zahau suggest ${ }^{*}$ row ${ }^{\text {I }}$ and Thado possibly reflects both variants. An explanation may possibly be found in the association of Northern Chin -ow with Old Burmese -wí, discussed in 5.2.3.1, which may perhaps tie in with Matisoff's observation (1972b:280) that Tangkhul Naga $-u j$, as opposed to $-o w,{ }^{483}$ sometimes correlates with Northern Chin -ow/-ow.

### 7.3 Nominalisation

Sporadic cases of denominal verbalisation with nouns being used as uninflected verbs in form 1 are attested throughout the word list. More significant to a morphological study of Northern Chin are cases of nominalisation of form 2 inflections as noted by Henderson (1976:9). The nominalising function of the $-s$ suffix in Old Burmese and Old Chinese was discussed in 2.4 .2 and 3.3.1 respectively and brings it into alignment with its function in Northern Chin. Three nouns *hu ${ }^{\text {IIf }}$ (<*hus) steam $n$,
 final $-s$ with their corresponding verbal counterparts $*{ }^{\text {HII }}$ steam $v i,{ }^{*}{ }^{\mathrm{h}}{ }^{\mathrm{II}}$ bitter $v i$, and * $t^{h} u^{\mathrm{II}}$ rot $v i$. Whether this has any connection with the establishment of $-s$ as a derivational suffix, requires further investigation. The following cases of nominalisation via suffixal $-s$ are attested in the word list:

[^157]| Verbal Forms 1~2 |  |  | Nominalised Form 2 |  |
| :---: | :---: | :---: | :---: | :---: |
| *bem ${ }^{\text {II }}$ | $\sim$ bem $^{\text {II }}$ | circular vi | * $\mathrm{bem}^{\text {III }}$ | basket $n$ |
| *boal ${ }^{1}$ | $\sim$ bual $^{\text {III }}$ | wallow vi | *boal ${ }^{\text {III }}$ | wallow $n$ |
| * dal $^{1{ }^{11}}$ | $\sim \mathrm{dal}^{\text {III }}$ | defend $v t$ | *dal ${ }^{\text {III }}$ | fence $n$ |
| * ${ }^{\text {doj }}{ }^{1}$ | $\sim \mathrm{doj}^{\text {III }}$ | give trouble (indirectly) $v t$ | *doj ${ }^{\text {III }}$ | spirit $n$ |
| * $\mathrm{jaj}^{\text { }}$ | $\sim \mathrm{jaj}^{\text {III }}$ | sing vi | * jaj ${ }^{\text {II }}$ | temperament $n$ |
| *jaw ${ }^{\text {I }}$ | $\sim \mathrm{jaw}^{\text {III }}$ | wide, sprawl vi | *jaw ${ }^{\text {III }}$ | surroundings $n$ |
| * ${ }_{\text {jal }}{ }^{1}$ | $\sim \mathrm{jral}^{1 \mathrm{II}}$ | roll vt | * $\mathrm{jral}^{\text {III }}$ | roll $n$ |
| * ${ }^{\text {jog }}{ }^{\text {I }}$ | $\sim \mathrm{jon}{ }^{\text {III }}$ | urinate vt | *jon ${ }^{\text {III }}$ | urine $n$ |
| *koajill | $\sim \mathrm{koj}$ 1 | bend vt | *koj? | bend $n$ |
| *koam ${ }^{\text {II }}$ | $\sim \mathrm{kvam}^{\text {II }}$ | indented vi | *koam ${ }^{\text {III }}$ | valley $n$ |
| *k ${ }^{\text {ha }}{ }^{\text {II }}$ | $\sim \mathrm{k}^{\mathrm{h}} \mathrm{ak}^{\text {II }}$ | phlegm vi | ${ }^{*} \mathrm{k}^{\text {hak }}{ }^{\text {II }}$ | phlegm $n$ |
|  | $\sim \mathrm{k}^{\mathrm{h}} \mathrm{aj}^{\text {III }}$ | hang, carry vt | * ${ }^{\text {h }}$ aj ${ }^{\text {jil }}$ | unspecifed mass $n$ |
| *k ${ }^{\text {h }}{ }^{\text {am }}$ | $\sim \mathrm{k}^{\mathrm{h}} \mathrm{mm}^{\text {III }}$ | precipitous vi | * ${ }^{\text {h }}$ am ${ }^{\text {III }}$ | precipice $n$ |
| * $\mathrm{k}^{\text {b }} \mathrm{n}^{\text {l }}$ | $\sim \mathrm{k}^{\mathrm{h}} \mathrm{n}^{\text {III }}$ | collect $\nu t$ | * $\mathrm{k}^{\text {l/ }} \mathrm{n} \mathrm{n}^{\text {III }}$ | pile of lumber $n$ |
| ${ }^{*}$ lak $^{\text {II }}$ | $\sim \mathrm{lrak}^{\mathrm{HI}}$-s | lick $v t$ | $*^{\text {la }}{ }^{\text {l/ }}$-s | lick $n$ |
| *loa ${ }^{\text {III }}$ | $\sim \mathrm{lvak}^{11}$ | vomit vi | *loak ${ }^{\text {II }}$ | vomit $n$ |
| *men ${ }^{\text {r }}$ | $\sim \mathrm{met}$ | catch vt | *met | captive $n$ |
| * ${ }^{\text {noj }}{ }^{\text {III }}$ | $\sim{ }^{\text {h }}$ nojiII | -smear vt | * ${ }^{\text {n }}$ noj ${ }^{\text {III }}$-s | milk, breast $n$ |
| *pom ${ }^{\text {II }}$ | $\sim \mathrm{pom}^{\text {III }}$ | spherical vi | *pom ${ }^{\text {III }}$ | belly, body $n$ |
| *p ${ }^{\text {b }}$ c $1^{1}$ | $\sim \mathrm{p}^{\mathrm{h}} \varepsilon \mathrm{l}^{\text {III }}$ | share-out vt | * ${ }^{\text {h }}$ 生 ${ }^{\text {III }}$ | piece $n$ |
| *p ${ }^{\text {Hat }}{ }^{\text {¹ }}$ | $\sim \mathrm{p}^{\mathrm{h}} \mathrm{iat}^{\text {II }}$ | ssweep vt | * $\mathrm{p}^{\mathrm{h}} \mathrm{iat}^{(1) \mathrm{I}}$ - | broom $n$ |
| * rin $^{1}$ | $\sim \mathrm{rin}^{\text {III }}$ | delineate $v t$ | *rin ${ }^{\text {II }}$ | line $n$ |
| *rol ${ }^{1}$ | $\sim$ rol $^{\text {III }}$ | withhold $v t$ | * $\mathrm{rol}^{\text {III }}$ | fence $n$ |
| *som ${ }^{1}$ | $\sim \mathrm{som}^{\text {III }}$ | invite, bind-together vt | ${ }^{\text {somm }}$ III | ten $n$ |
| *sum ${ }^{\text {I }}$ | $\sim \operatorname{sum}^{\text {III }}$ | withhold vt | *sum ${ }^{\text {III }}$ | fist-measure $n$ |
| *tom ${ }^{\text {I }}$ | $\sim \mathrm{tom}^{\text {III }}$ | tie hair-bobv | ${ }^{\text {tom }}{ }^{\text {III }}$ | hair-bob n |
| *t ${ }^{\text {b }}{ }^{\text {a }}{ }^{\text {I }}$ | $\sim t^{\text {h }}{ }^{\text {a }}{ }^{\text {d }}$ | fat vi | * $\mathrm{t}^{\text {la }}$ aw ${ }^{\text {III }}$ | fat $n$ |
| *tsen ${ }^{\text {II }}$ | $\sim$ tsen $^{\text {III }}$ | slice $\nu t$ | *tsen ${ }^{\text {II }}$ | slice $n$ |
| ${ }^{*} \mathrm{w}^{\text {j }}{ }^{\text {I }}$ | $\sim \mathrm{wej}$ [ll | swing vt | *wejill | times $n$ |
| *won ${ }^{\text {II }}$ | $\sim$ won $^{\text {III }}$ | wear vt | * won ${ }^{111}$ | load, clothes $n$ |

There are a handful of examples where some languages have a nominal form 1 rather than form 2. In the case of nose $n$ they appear to be in free-variation in Mizo, although Weidert, in Benedict (1988a:263), makes a distinction of ${ }^{\text {h }}{ }^{\text {nar }}{ }^{\text {l }}$ nose $n$ and ${ }^{\text {h }}$ nar ${ }^{\text {III }}$ trunk (of elephant) $n$ which is not noted here.

7.4 Initial Aspiration

That a prefixal $s$ - may have caused initial aspiration in Northern Chin transitive inflections is proposed by Wolfenden (1929:185-6) who also makes a comparison with Burmese. As with the Burmese cases, mentioned in 2.2, the process is no longer productive but a few more isolated examples in Tedim and Sizang are provided by Henderson (1965:22) and Stern (1963:251) respectively. Although the original functions of the $s$ - prefix and the $-s$ suffix tend to coalesce, the former only seems to represent an alternation of transitivity without attesting the full causativity paradigm associated with the latter. However, it seems unnecessary to draw a fundamental grammatical distinction here as the benefactive derivations of suffixal $-s$ seem to be simply an extension of its transitive derivations under the broad notion of causativisation discussed in 7.1.5. The following cases are attested in the word list:

| Intransitive ( $v i$ ) |  | Transitive (vt) |  |
| :---: | :---: | :---: | :---: |
| * kin $^{\text {II }}$ | move vi | * ${ }^{\text {Hin }}{ }^{\text {II }}$ | move vt |
| * ${ }^{\text {kj }}{ }^{1}$ | hang vi | * $\mathrm{k}^{\text {h }} \mathrm{j}^{\text {l }}$ | hang $v t$ |
| *kay ${ }^{\text {II }}$ | rise vi | * $\mathrm{k}^{\text {ha }} \mathrm{m}^{\text {II }}$ | raise $v t$ |
| *kok | peel up $v i$ | * ${ }^{\text {h }} \mathrm{j}$ k | peel up vt |
| * ${ }^{\text {kıa }}{ }^{\text {III }}$ | drop vi | * $\mathrm{k}^{\mathrm{H}} \mathrm{I}^{\text {III }}$ | drop vi |
| * $\mathrm{kreg}^{\text { }}$ | distend vi/t | * $\mathrm{k}^{\text {hren }}{ }^{1}$ | increase $\mathrm{vi}^{484}$ |
| * $\mathrm{krII}^{\text {iI }}$ | drop vi | * $\mathrm{k}^{\mathrm{h}} \mathrm{rr} \mathrm{l}^{\text {III }}$ | drop vt |
| *kris | scare $v i$ | * ${ }^{\text {h }}$ rrs | scare vt |
| *krom ${ }^{\text {II }}$ | decrease vi | * $\mathrm{k}^{\text {h }} \mathrm{rom}{ }^{\text {II }}$ | decrease $v t$ |
| *kret | tear, tatty vi | * ${ }^{\text {h }} \mathrm{rct}$ | tear, make tatty $v t$ |
| * $\mathrm{kla}^{\text {II }}$ | drop vi | * ${ }^{1 / 1} \mathrm{la}^{\text {II }}$ | drop vi |
| *klep | fold vi | * ${ }^{\text {h }}$ lep | fold $v t$ |
| * $\mathrm{kliak}^{\text {IIb }}$ | snap vi | * $\mathrm{k}^{\text {limak }}{ }^{\text {IIL }}$ | snap vt |
| *klaj ${ }^{\text { }}$ | hang vi | * ${ }^{\text {l }}$ laj ${ }^{1}$ | hang vt |
| * $10 \mathrm{~m}^{\text {III }}$ | lie vi | * ${ }^{\text {l }} \mathrm{lom}{ }^{\text {III }}$ | lay vt |
| *par ${ }^{\text {III }}$-s | unfurl vi | *p $\mathrm{p}^{\text {h }}{ }^{\text {IIII }}-\mathrm{s}$ | unfurl $v t$ |
| *pur ${ }^{\text {II }}$ | fall vi | *phur ${ }^{\text {II }}$ | fall vt |
| *pok | put on end vi | ${ }^{*}{ }^{\text {h }}$ \%k | put on end vt |
| *pel ${ }^{\text {II }}$ | detach vi | ${ }^{*}{ }^{\text {n }}$ 成 ${ }^{\text {II }}$ | detach vt |
| *puan ${ }^{1}$ | divulge $v i$ | *p ${ }^{\text {h }}$ vay ${ }^{\text {l }}$ | divulge $\nu t$ |
| *pII ${ }^{\text {r }}$ | sink vi | *p ${ }^{\text {li }} \mathrm{I}^{1}$ | depose vt |
| *pes | pierce vi | ${ }^{*}{ }^{\text {l }}$ ¢ ${ }^{\text {c }}$ | pierce vt |
| * $\mathrm{ril}^{\text {III }}$ | roll along/down vi | * $\mathrm{ril}^{\text {III }}$ | roll along/down vt |
| * $\mathrm{tbl}^{\mathrm{HI}}$-s | slide vi | * $\mathrm{t}^{\mathrm{h}} \mathrm{J}^{\mathrm{HI}}-\mathrm{s}$ | slide $v t$ |

[^158]In the discussion of $-s$ suffixation above, some cases with concomitant aspiration via $s$ - prefixation were noted; this parallels the situation in Burmese, discussed in 2.4.2, perfectly. The following cases are attested in the word list:

| Intransitive (vi) |  | Transitive (vt) |  |
| :---: | :---: | :---: | :---: |
| * $\mathrm{kram}^{\text {II }}$ | decrease vi | * $\mathrm{k}^{\text {h }} \mathrm{Iam}^{\text {III }}$ ( $<$ * $\mathrm{kiam}^{\text {II }}$-s) | decrease vt |
| * $\mathrm{kir}^{\text {I }}$ | return vi | * $\mathrm{k}^{\text {h }} \mathrm{ir}^{\text {IIII}}$-s | return vt |
| * $\mathrm{krrak}^{\text {II }}$ | disperse vi | *k ${ }^{\text {h }}$ riak ${ }^{\text {II-s }}$ | disperse vt |

| *tsaj ${ }^{\text {II }}$ | play vi | * ts $^{\text {la }}{ }^{\text {a }}{ }^{\text {[1] }}-\mathrm{s}$ | tease v t |

### 7.5 Allofamy

Matisoff (1978a:16-7) coins the term allofam to account for words in separate TibetoBurman languages ${ }^{486}$ which appear to be derived from the same root but which violate regularly assumed sound-laws. Such lexical variations are noted by Benedict but he prefers to attribute it to unclearly defined phonological/morphological alternations. Peiros (1998:206-7) suggests that Matisoff's approach demonstrates a lack of methodological rigor and Sagart (2006a:210-1) specifically criticises Matisoff for disregarding Benedict's observation (1972a:124) of an association in initial position of voicing with intransitivity and voicelessness with transitivity as discussed in 3.5.2.3. Peiros' and Sagart's criticisms are partially warranted but the discussion in 8.1 of neogrammarian versus lexical diffusional hypotheses for sound change provides some support for Matisoff's approach providing it is not applied as a wildcard.

### 7.5.1 Consonants

The complexity of correspondences between initials was discussed in the introduction to Chapter 4. In the development of codas, the derivation of $-7,-t$ and $-k$ from the same $-s$ suffix in Northern Chin helps remove some of Matisoff's allofamic variations, yet in certain cases the evidence is less conclusive. The word *nep snot $n$ is homophonous with the form 2 of smell vt in Thado, Zo, Tedim and Sizang and appears to be a regular nominal derivation from nem ${ }^{\text {III }}$-s > nem?; the Mizo and Zahau form 2 of smell $v t$ is predictably ${ }^{\mathrm{h}} \mathrm{nem}^{\text {IIb }}$ but the word for snot $n$ occurs with an

[^159]obstruent coda as ${ }^{\text {h }}$ nep. ${ }^{487}$ A cross-linguistic semantic link of nose $n$ and snot $n$ is supported in Wilkins (1996:284) but, notwithstanding the partial phonological similarity, the Northern Chin word for nose $n, *^{* h}$ nar $^{1 / 11}$, has an $-r$ coda and it is unclear whether the semantic link with snot $n$ can be extended to smell vt. ${ }^{488}$ With Burmese also attesting a nasal in the verbal form and an obstruent in the nominal form, for the time being the tantalizing close yet insurmountable phonological and semantic difficulties must keep the two roots apart: ${ }^{489}$
[\#96] Smell
[M] *nam (2003:250-1)
[P\&S] *nam (1996:\#535)
[NC] *nem ${ }^{1}$ smell vi
The transitive form ${ }^{* h} \mathrm{nem}^{\text {III }}$ smell $v t$ in tone III has concomitant initial aspiration.
[OB] nã ${ }^{1} \dot{\Phi}$ nam $^{1}$ smell $v i$
Stewart \& Dunn (1940-81:192-3) noted the tone III derivation, nã ${ }^{\text {III }} \dot{\Phi}_{0}$ nam $^{\text {III }}$ smell $n / v t$, to not always be precisely differentiated after a nominalising prefix. The transitive sense of tone III is generally now only reflected in nã $\$ \delta \delta: n a{ }^{I I}$ smell vt which is curiously reflected in the Loloish forms in Bradley (1979:342-3) as intransitive. The attestation of a verbal sense of smell in all three tones in Burmese suggests there has been some confusion. ${ }^{490}$

## [\#97] Snot

[M] $\quad$ *s-nap (2003:336) $^{2}$

[^160][P\&S] *s-nap (1996:\#553)
[NC] *hnep snotn
[OB] ${ }^{\text {h }}$ na? ${ }^{\text {s }} \delta{ }^{\text {h }}$ nap mucus, snot $n$

### 7.5.2 Vowels

Benedict appears reluctant to commute vocalic variation back to Tibeto-Burman but is forced to admit it for apparent alternations between $i$ and $u$ (1972a:80), $i$ and $j a$ (1972a:84), and the secondarily derived vowels $e / o$ with the primary vowels $i / u / a$ (1972a:68-9). In the first case Benedict notes that the alternation is predominantly associated with Garo; Burling (2004:26-7) more recently associates this with features of labiality. ${ }^{491}$ Benedict (1976a:178-9) attempts to remove the alternation between $i$ and $j a$ in two roots: in the case of Eye $n$ (\#71), Matisoff (1978a:240-1) queries Benedict's setting up of a $a$ vowel before a non-glide coda ${ }^{492}$ but it appears that the curious vocalism may rather be attributed to a specific feature of the coda; in the case of pheasant $n$, the allofamic variations pertain to languages beyond the scope of this paper but the Northern Chin and Old Burmese forms are noted as loanwords in 6.5.4. Two of the three cases of alternations with secondary vowels relevant to the work here, thorn $n$ and hammer $n$, are discussed in 5.2.3.1 and appear to stem from faulty comparisons. In the third instance, Benedict appears to be hitting on the basic $\partial / a$ vocalic alternation underlying Sino-Tibetan as a whole:

## [\#98] Near

[M] $\quad{ }_{\text {s-nej }}$ **s-na:j $(2003: 215 ; 220)$
[P\&S] *nəj (1996:\#560)
[NC] * ${ }^{\text {naj }}{ }^{\text {il }}$ near $v i$
The rhyme correlates with Loloish *naj ${ }^{\text {I }}$ from an original -al as opposed to the Burmese form representing an ablaut with -ol.
[OB] $\mathrm{ni}^{\mathrm{II}} \stackrel{\text { ¢ }}{\text { ¢ }}: \mathrm{ni}^{\mathrm{II}}$ near, intimate $v i$

[^161]Matisoff (1998:\#21305) reconstructs Loloish *naj $^{\text {II }}$ noting that this does not concur with the Burmese reflex $v i$; the Loloish form appears to represent the Old Chinese ablaut in *'nal ${ }^{11}$.

The Shijng rhyming suggests ${ }^{*}$ nol ${ }^{\text {II }}$ but the Middle Chinese form suggests *'nal ${ }^{\text {II }}$; the former corresponds to the Burmese form while the latter to the Northern Chin etyma.

Another case of $\partial / a$ variation may perhaps be found below:

## [\#99] Low, soft

[M] $\quad{ }_{\text {s-njam }}(2003: 290 ; 299)$
[P\&S] *nem (1996:\#575)
[NC] *hnam ${ }^{\text {li }}$ low $v i$
Matisoff associates *nem ${ }^{\mathrm{I}}$ soft vi, with which Benedict (1983:15) further associates ${ }^{* h}$ nem ${ }^{\text {III }}$ comfort $v t$ via an original meaning soften $v t$, but an account also needs to be made for the tonal distinction. ${ }^{493}$
[OB] nã̃ ${ }^{\text {II }}{ }^{\text {º }}$ nam ${ }^{\text {III }}$ soft, inferior, subside (as pain/fever) vi vi
Matisoff reconstructs a separate allofam *nem to compare neril
 lower $v t .{ }^{494}$ Alternatively an ablaut variation of *njam and *njom could be

[^162]proposed in which the derived palatal nasal $n$ - of n $\tilde{a}^{\text {III }}{ }^{\text {º }}$ nam ${ }^{\text {III }}$ remained as $n$ in neilil $\$ \oint{ }^{\text {II }} \mathrm{nim}^{\text {III }}$ due to $-j$ - merging to $-i$ before initial palatalisation could occur.
[OC] \{an $^{\text {II 染 }}$ niam ${ }^{\text {II/III }}<*^{\prime}$ njam $^{\mathrm{n} / \text { III }}$ soft $v i$
The proposed Burmese ablaut with $\partial$ is perhaps also attested in $\nexists \mathrm{n}^{\mathrm{nII}}$ 荏 nim ${ }^{\mathrm{II}}<$ *'njam ${ }^{\mathrm{II}}$ soft $v i$.

In addition to cases where $a$ appears to have shifted to $a$ between Old Chinese and Middle Chinese, ${ }^{495}$ Pulleyblank (1963:220-1, 1965a:238-9) believes a morphological ablaut can be set up for Old Chinese and further suggests (1965a:237-40) that this can be extended back to Sino-Tibetan as a whole. ${ }^{496}$ The idea of a morphological ablaut in Tibeto-Burman is first proposed by Miller who, in his study of Burmese (1956:47-9), suggests two systems of ablaut based on three different vowels in each. His work is strongly criticised by Nishida (1957:57-8), Benedict (1972a:69-70) and Matisoff (1975:166) who note that little attention has been paid to semantics. ${ }^{497}$ Miller (1957:42-3) further proposes that vocalic mismatches between early Inscriptional Burmese, as attested in the Myazedi Inscription, and Written Burmese are evidence for an original ablaut, but this is unlikely; Duroiselle (1919:15) proposes that these variations represent a language in transition but Ba Shin's study (1962:36-9) of the regularities behind the alternations shows them to represent little more than orthographic variation before the script was standardised. Returning to Pulleyblank's proposal, he is unable to find any examples in Burmese (1965a:239) and his examples in Tibetan (1965a:233-7) are strongly contested; ${ }^{498}$ Benedict (1972a:69-70) does not

[^163]reject Pulleyblank's handful of possible Old Chinese examples but notes much more evidence is required before any meaningful conclusions can be drawn; this seems to be a fair assessment. Whatever the diachronic status of vowel ablaut in Sino-Tibetan may be, there are several cases of synchronic alternation in Northern Chin. The extent to which these can be commuted back to phonological conditioning environments remains to be clearly established.

### 7.5.2.1 The e/a and $\varepsilon / e$ Ablaut

Noting the variation between Tedim $\operatorname{sen}^{1}$ and Mizo/Thado sen ${ }^{1}$ red vi, Benedict (1972a:17-8) suggests that both derived from an original palatal medial $-j$ - that fronted the Mizo and Thado vocalism but left Tedim unchanged. The free-variation of $\operatorname{sen}^{\mathrm{L}}$ and $\operatorname{sen}^{1}$ in Thado is not noted by Benedict who appears unaware of the sporadic $e / a$ and $e / \varepsilon$ ablaut across Northern Chin which suggests synchronic euphony to be as likely a cause as diachronic phonology. Nevertheless, although it seems that in most cases $e / a$ was original, in a select few cases it seems $e / \varepsilon$ may have been original with e/a emerging via analogy. This in fact seems to be the case with red $v i$ :
[ $\# 100$ ] Red
[M] *t(s)ja-n (1995:54-5)
[P\&S] *(s ${ }^{\text {h }}$ e:n (1996:\#1210)
[NC] *sen ${ }^{1}$ red $v i$
[OB] -
 on the assumption that opp toja means very red vi. Nishi's rejection (1974:19;43) of the use of such forms in Lolo-Burmese reconstruction was discussed in 2.3.1.4 but equally vitiating are the forms listed by Bernot (1978-92:VII:56-7) that show such a meaning to be only attested when preceded by $n i^{\mathrm{I}} \$ \mathrm{nit}^{1}$ red vi. ${ }^{499}$ This concomitantly nullifies Matisoff's proposed

[^164]association, also suggested by Peiros \& Starostin (1996:\#918) and Sagart (2006a:220), with $\tan ^{1}$ 丹 $\tan ^{\mathrm{I}}$ red vi, cinnabar n. ${ }^{500}$

The following cases are also attested in the wordlist:

| * ¢rn $^{\text {II }} /$ ใen ${ }^{\text {II }}$ | foodn | ${ }^{*} \mathrm{p}^{\mathrm{h}} \mathrm{el}^{\mathrm{l}} / \mathrm{p}^{\mathrm{h}} \mathrm{El}^{\mathrm{l}}$ | share-out, permit vt |
| :---: | :---: | :---: | :---: |
| * $\mathrm{Caw}^{\text {/ }}$ / $\mathrm{ew}{ }^{\text { }}$ | noisy vi | ${ }^{*} p^{\text {h }} \mathrm{n}^{1} / \mathrm{p}^{\mathrm{h}} \mathrm{ay}^{1}$ | flat vi |
| *hel ${ }^{\text {I }} / \mathrm{hc1}{ }^{\text {II }}$ | mix vi | * $\mathrm{rek}^{\text {II }} / \mathrm{rak}^{\text {II }}$ | tighten vt |
| *jek / jek | ashamed vi | * ${ }^{\text {remm }}$ / $/{ }^{\text {b }} \mathrm{rem}^{\text {II }}$ | otter $n$ |
| *kek / kek | crack vi | *tel ${ }^{1} / \mathrm{tc} 1^{1}$ | muscle $n$ |
| * $\mathrm{k}^{\mathrm{h}} \mathrm{el} 1-\mathrm{s} / \mathrm{k}^{\mathrm{h}} \mathrm{E} 1-\mathrm{s}$ | overtake vt | * ter $/$ /ter ${ }^{1}$ | elderly, firm vi |
| * $\mathrm{k}^{\mathrm{h}} \mathrm{leg}^{\text {d }} / \mathrm{k}^{\mathrm{h}} \mathrm{lq} \mathrm{g}^{\text {t }}$ | choose vt | * $t^{\text {h }} \mathrm{a} \eta^{1 / 4 /} / \mathrm{t}^{\text {h }} \mathrm{m}^{\text {II }}$ | reek $v i^{501}$ |
| ${ }^{*} \mathrm{lag}^{1} / \mathrm{leg}{ }^{1}$ | visit, fly, epidemic vi | * tsel $^{1} /$ tsel ${ }^{1}$ | male $n$ |
| * $\mathrm{men}^{1} / \mathrm{men}{ }^{\text {r }}$ | catch, sticky vi | * $\operatorname{scs}^{\text {III }} /$ tsel $^{\text {III }}$ | forehead $n$ |
| *prj / pej ${ }^{\text {II }}$ | go vi | * $\operatorname{sen}^{\text {I }} /$ tsen $^{\text {II }}$ | slice vt |
| * $\mathrm{pen}^{1} / \mathrm{pen}{ }^{1}$ | thin vi | *tset / tset | snap vi |

In certain cases an ablaut variation appears to have been exploited to create a new semantic distinction or more explicitly define an already existing one: Zahau kek crack $v i$ and kek crack $v$ t, Thado ${ }^{*} \operatorname{ter}^{1}$ hard $v i$ and ter ${ }^{1}$ elderly $v i .^{502}$

### 7.5.2.2 Other Cases

Disambiguating phonoaesthetics from alternations of true phonological import needs to be addressed on an individual basis. There is sporadic evidence of secondary vowel rounding in words originally with initial ${ }^{*} w$ - as shown under Bear (\#29), where *wem ${ }^{1}$ has uniformally rounded to vom ${ }^{1}$, while leech $n$ is attested as vet in Mizo and Zahau but vot elsewhere:

[^165][\#101] Leech
[M] *k-r-p ${ }^{\text {wat }}(2000: 150-3)$
[P\&S] *wat (1996:\#446)
[NC] *wat / *wet leech n

The modern spelling with medial $-j$ - is a corrupted form; see Nishi (1977:46-7) for further discussion. Matisoff (1972a:65) notes the Loloish forms to reflect *wat and treats the Burmese form as attesting the velar animal prefix followed by an unspecified $-r$ -

Another possible case is *wen ${ }^{\text {III }}$ / won ${ }^{\text {III }}$ load $n$ which is treated in the word list as a nominalisation of *won ${ }^{11}$ wear vt but may alternatively be associated with *won ${ }^{1}$ pregnant $v$, offspring $n$ via a semantic link like bear $v t$ and bairn $n$ that would also suggest a link with Burmese wũ ${ }^{1}$ ©థ̣ wan ${ }^{1}$ load, burden $n .{ }^{503}$

Several other cases appear to be loans or onomatopoeic words: ${ }^{*}{ }^{(\mathrm{hb})} \mathrm{la}{ }^{\text {Ilb }} d r o p v$ and $* \mathrm{k}^{(\mathrm{h})} \mathrm{lu}^{\mathrm{Ilb}}$ fall $v$ are discussed under Fall (\#8) where Mon-Khmer influence is suggested to have played a role; $* \mathrm{kla}^{\mathrm{II}} / \mathrm{klo}^{\text {II }}$ tiger $n$ is discussed in 6.5.4; $* \operatorname{dot}^{\mathrm{I}} / \operatorname{dut}^{\mathrm{I}}$ drink $v t$ and *hup ${ }^{\mathrm{I}} / \mathrm{hop}^{\mathrm{I}} / \mathrm{hip}^{\mathrm{I}}$ slurp vt have non-native tone I with a stop coda; t $^{\mathrm{h}} \mathrm{ey}^{\mathrm{I}} / \mathrm{t}^{\mathrm{h}} \mathrm{oy}^{\mathrm{II}}$ echo,
 downpour $v i$ all have additional irregularities. The following cases are also attested in the wordlist where they are listed under their first alternant:

| * $2 \mathrm{rr}^{\text {r }} /$ Por ${ }^{\text {r }}$ | neck $n$ |  | fold $v t$ |
| :---: | :---: | :---: | :---: |
| * $\mathrm{brl}^{\text {11 }} / \mathrm{bol}^{\text {I }}$ | blunt vi | *h $\mathrm{lem}^{\mathrm{L}} / \mathrm{h}^{\mathrm{lim}}{ }^{1}$ | strip vt |
| *boy ${ }^{1 / \text { III }} /{ }^{\text {/ }} \mathrm{bry}{ }^{\text {III }}$ | container $n$ | * ${ }^{\text {h }} \mathrm{um}^{\text {II } / ~}{ }^{\text {h }} \mathrm{lim}^{\text {II } / \mathrm{h}}{ }^{\text {lom }}{ }^{\text {II }}$ | ball $n$, sphericalise $v$ |
| * $\mathrm{buk}^{\text {II }} / \mathrm{bokk}^{11}$ | hut $n$ | ${ }^{*} \operatorname{mon}^{\text {II }} / \mathrm{men}^{\text {III }}$ | clitoris $n$ |
| * $\mathrm{don}^{\text {II }} / \mathrm{dey}{ }^{\text {II }}$ | hinder vt | *nem ${ }^{\text {I }}$ / nom ${ }^{\text {II }}$ | push vt |
|  | drip $n / v i$ | * ${ }^{\text {nok }}$ / $\mathrm{nek}^{\text {d }}$ | jostle vi |

[^166]| *dzop ${ }^{\text {II }}$ / dzep ${ }^{\text {II }}$ | suck vt | * ${ }^{\text {hem }}$ III / ${ }^{\text {h }}$ nim ${ }^{\text {III }}$ | smell vt |
| :---: | :---: | :---: | :---: |
|  | erect vi | * ney $^{\text { }} /$ yon $^{\text {² }}$ | dawdle vi |
| *haj ${ }^{\text {II }} / \mathrm{hoj}^{\text {II }}$ | skim off vt | * $\mathrm{paj}^{\text {II }} / \mathrm{poj}^{\text {II }}$ | carry on oneself vt |
| *hey ${ }^{1} /$ hoy $^{1}$ | hollow vi | *put ${ }^{\text {II }}$ / $\mathrm{pot}^{\text {II }}$ | emerge vi |
| *hon ${ }^{\text {II }} / \mathrm{hoy} \mathrm{y}^{11} / \mathrm{hr}^{\text {II }}$ | come vi | *p ${ }^{\text {hi }} \mathrm{il}^{\text {II }} / \mathrm{p}^{\mathrm{h}} \mathrm{ul}^{\text {II }}$ | snout, butt vt |
| * $\mathrm{jal}^{1} / \mathrm{jol}^{1}$ | beam $n$, recline $v i$ | *tom ${ }^{\text {III }} /$ tom $^{\text {III }}$ | fist, block, hair-bob n |
| *jial / joal ${ }^{\text {r }}$ | roll $\mathrm{v} / \mathrm{n}$ |  | thread vt |
| * $\mathrm{jog}^{1} / \mathrm{jig}{ }^{\text {l }}$ | urinate vt, urine $n^{504}$ | * wel ${ }^{\text {III }}$-s $/ \mathrm{wol}^{\text {IIII }}$-s | swallow vt |
| * $\mathrm{kog}^{1} / \mathrm{ken}{ }^{1}$ | rodn | *wot / wit | pierce vt |
| *kun ${ }^{\text {II }}$ / $\mathrm{kon}^{\text {II }}$ | bow vi | *wot/ wot | ash n |
|  | resound, hammer $v$ | *woji / wej ${ }^{1}$ | swing vt, times $n^{505}$ |
| $*^{\text {k }} \mathrm{mm}^{\text {III }} / \mathrm{k}^{\mathrm{h}} \mathrm{om}^{\text {III }}$ | put on head vt | *wej' ${ }^{\text {III }}$-s / wojilils | fart $n$ |
| *klom ${ }^{\text {/ }}$ klem ${ }^{\text {1 }}$ | few $v i$ |  |  |

As with the $e / a$ and $\varepsilon / e$ ablaut, semantic specialisation may occasionally be noted: Zahau $*$ ?rr' front of neck (animals) $n$ and $*$ ?or ${ }^{1}$ front of neck (humans) $n, \mathrm{t}^{1} \mathrm{a}^{\mathrm{Ib}}$ drop $v i$ and $\mathrm{t}^{\mathrm{L}} \mathrm{u}^{\mathrm{rb}}$ fall vi. ${ }^{506}$ It is also possible that certain words like $*^{\mathrm{h}} \mathrm{n}^{\mathrm{n}} \mathrm{y}^{\mathrm{I}}$ back $n$ and ${ }^{\mathrm{h}} \mathrm{n}^{\mathrm{h}} \mathrm{g}^{\mathrm{I}}$ rejected vi or $\mathrm{zvy}^{\mathrm{II}}$ finger, root $n$ and zay ${ }^{\mathrm{II}}$ penis $n$ may be associated but there is no confirmatory evidence.

[^167]
## Chapter 8: Concluding Remarks

The establishment in the preceding chapters of regular sounds laws, both segmental and suprasegmental, as well as morphological associations, including an elucidation of the intricate Northern chin verbal paradigms, attempts to provide greater legitimacy to the Sino-Tibetan hypothesis. Nevertheless, the work raises questions regarding two intractable linguistic issues: the interaction between Neogrammarian sound laws and lexical diffusion; the nature of the dichotomy between vowels and consonants.

### 8.1 Lexical Diffusion

Under the rubric of lexical diffusion, Wang (1969:12-8) suggests that exceptions to regularly defined sound laws makes it more reasonable to assume that individual words, rather than individual phonemes, are the units of change. His proposal that sound change progresses gradually throughout the lexicon causing abrupt phonological changes in affected words represents an inversion of the Neogrammarian approach where sound change is treated as phonologically gradual but lexically abrupt. Pulleyblank (1978b:183-5;190, 1982c:397-401) suggests that the idea that a group of speakers would simultaneously alter a single word as opposed to a class of words is equally unlikely, and suggests that external sociological influences may have more influence than Wang concedes. Developing proposals made in Chen \& Wang (1975) for a distinction between actuation and implementation, and acknowledging Egerod's concerns $(1976,1982)$ regarding over-application of the theory, Wang \& Lien (1993:381-2) respond that Pulleyblank's rejection is too dogmatic and that in addition to internal factors, external sociological influences may actuate a sound change which is then implemented by lexical diffusion. Although Wang \& Lien are accommodating of some of the criticisms levelled against them, they still retain the idea that lexical diffusion should replace the Neogrammarian approach and it is unlikely that this would appease Pulleyblank, or indeed Egerod (1982:169) who prefers to follow Labov's belief (1981) that the Neogrammarian hypothesis and lexical diffusion are not mutually incompatible.

Labov (1981:303-4) suggests that the distinction may lie in degrees of abstractness of the phonetic realisation from the original underlying phoneme which occurs to a greater degree in changes involving lexical diffusion. While this is an interesting
theory which should be tested further, it does little to address the actual cause. This is addressed more clearly by Labov (1994:542) with the suggestion that sound change according to the Neogrammarian hypothesis occurs internally by causing incremental phonetic shifts in phonemes which eventually may realign themselves with a different phoneme, while sound change according to lexical diffusion reflects more abrupt phonemic differentiation triggered by external sociological factors or internal lexical or grammatical conditioning affecting the later stages of what was originally an internal change. Although not entirely explicit, Labov's assumption appears to be that underlying all cases of lexical diffusion are regular Neogrammarian sound laws which are allowed to progress their course, equally affecting all phonemes in the same environment, until other processes intervene. The relevance of this to the Northern Chin cases will be discussed below. ${ }^{507}$

### 8.1.1 External Conditioning

At the present stage, Thado 3 - and $z$-, discussed in 1.5.4, appear to be allophones in free-variation which a purely internal and synchronic analysis would exclude from any discussion regarding sound change. However, Peterson's proposal (2000:80), noted in 4.8.2, that a shift of original $*_{j}$ - to $z$ - first occurred in languages like Mizo and Zahau and then spread north, supports the fact that Thado, as the furthest north of the six languages discussed, is the only one that does not uniquely attest $z$-. Although the expected development for Thado would be the eventual loss of the 3 - allophone, its retention of this intermediate stage suggests that interaction with its more southerly neighbours has allowed the introduction of $z$-into the phonemic inventory before the original shift has completed its course. Although only free-variation is attested here, future research may perhaps unearth cases of lexical diffusion as is possibly the case in a similar situation concerning the Zo dialectal distinction, discussed in 1.5.3, between ${ }^{h} l$ - and $h$ - from original ${ }^{*} k^{h} l$-. The development to $h$ - appears to be a further development from ${ }^{h} l$ - but in the case of one speaker, a lexical distinction appears to have been made distinguishing ${ }^{h} l$ - and $h$-which, having no phonological conditioning environment, appears to be a result of lexical diffusion via the contact of an ${ }^{h} l$-dialect with an $h$ - dialect. A clear case of mutual influence among Northern Chin languages

[^168]was discussed in 7.2.2 where Tedim morphological alternations were shown to have been adopted by Zo and Sizang.

### 8.1.2 Internal Conditioning

Wang \& Lien (1993:353-5) suggest that lexical diffusion resolves the antinomy between the Neogrammarian hypothesis and analogy by rescuing the latter, along with borrowing, from serving as a catch-all account for irregularities. Within the parameters of Labov's interpretation, analogy may be added to grammatical or lexical conditioning as an internal actuator of lexical diffusion. This creates an ironic situation whereby the regularity caused by analogical levelling may be treated as lexical diffusion in spite of the concept of lexical diffusion being devised by Wang to account for cases of irregularity. A good example of analogical levelling as lexical diffusion is the verbal paradigms discussed in 7.1.4 where analogy is assumed to have derived the rest of the lexicon after the derivational $-s$ suffix had disappeared. ${ }^{508}$ Notably, grammatical conditioning appears to have been able to disrupt this regularity as attested in the development of $-\eta^{\text {tII }}$ that does not show the coronalisation otherwise attested in the change $-\eta^{1 / 7}-s>-n^{\text {III }}$. Nevertheless, a pitting of analogical conditioning against grammatical conditioning in terms of regularity appears untenable due to apparent de-regularising effects of analogy: the evidence for a shift $-s>-?>-^{n b}$ after nasal codas in Mizo and Zahau suggests that the occasional occurrence of tone IIb instead of -1 after liquid and glide codas is an analogical extension. The above alternations have sometimes ousted the original, are sometimes in free-variation, but occasionally show evidence for secondary grammatical conditioning in verbal inflections or in subtle shifts in semantics. In this regard it may be suggested that while the irregularities appear to be analogically derived, the real actuator is grammatical conditioning with the alternations simply being the ones to which the language is most amenable due to similar instances elsewhere.

### 8.2 Vowelless Languages

Although languages attesting vertical vowel systems have been accorded some legitimacy by Ladefoged and Maddieson (1995:286), Colarusso's treatment

[^169](1997:122-3) of them as rare developments from original triangular systems only mildly tempers Szemerényi's charges (1967:74-5) of statistical insignificance. ${ }^{509}$ The reconstruction of a Sino-Tibetan $\partial / a$ vowel system suggests that rather than being left languishing in a linguistic hinterland, vertical vowel systems are representative of a more primordial situation underlying the very phonological foundations of language. It is unlikely mere coincidence that the Indo-European language family, upon which the whole enterprise of historical linguistics was founded, is also suggestive of such a system.

### 8.2.1 Indo-European

Under the premise that $i$ and $u$ pattern as glides ${ }^{510}$ and $a$ is too insignificant to be a primary vowel, Saussure $(1879: 70-1 ; 135)$ reduces the Indo-European vowel system to a single vowel $a_{1}$ with an ablaut variant $a_{2}$ for which he acknowledges a correlation with $e$ and $o$ in other analyses. The typological peculiarity of the remaining e/o vowel system leads Allen (1956:172-4, 1965), Pulleyblank (1965b:91-2, 1993b:68-74), and Colarusso (1981:499-501) to suggest that this may actually reflect a vertical $\partial / a$ system. It is ironic that this reanalysis represents an attempt to make the IndoEuropean vowel system typologically more reasonable by appealing to a construct generally dismissed as typologically anomalous. Interestingly, reconstructing $a$ for $o$ allows an account for the sporadic $a$ vowel in Sausurre's analysis to be made: Pulleyblank's (1965b:89, 1993b:73-4) and Colarusso's (1981:499-501;536) proposal that a new $a$ vowel emerged from an original laryngeal to displace original $a$ to $o$ is supported by Villar (1993:152) who further adds (1993:148) that the many $a$ reflexes of original $o$ in daughter languages make a shift from $a$ to $o$ as likely as one of $o$ to $a .{ }^{511}$ An association of $e$ with $\partial$ is questioned by Villar (1993:157-8) due to a lack of direct evidence, but Allen (1965:116) and Colarusso (1981:499-500) note the salient features behind the vowel to be one that is neither back nor maximally open and that a shift from of $a$ to $e$ nicely parallels that of $a$ to $o$; Pulleyblank (1993b:74) further proposes that the phonological reanalysis of $j$ and $w$ as $i$ and $u$ would have triggered a

[^170]shift from $\partial$ to $e$ in accordance with the proposals in Crothers (1978:109) that the common vowel system $i, u, e, a$ derived from an original and $i, u, \partial, a .^{512}$

### 8.2.2 Northwest Caucasian

### 8.2.2.1 $\underline{\text { Abaza }}$

Saussure's reduction of the Indo-European vowel system to a single vowel with an ablaut variant leads Jakobson $(1958: 23)$ to comment that such a unitary vowel system is not supported anywhere in the world. Allen (1958:28), referring back to his earlier study (1956:142;172) of the Northwest Caucasian language Abaza, responds that the vertical $\partial / a$ vowel system attested there may be treated as only having one vowel $a$ if $\partial$ is treated as an epenthetic product of syllabic stress placement that alternates with zero in unstressed positions. Jakobson (1958:34) responds that this violates established principles of phonemic differentiation but, as Kuipers (1968:83) remarks, this does not necessarily make the establishment correct. A more interesting line of query could have centred on the fact that Allen is treating $a$ as the solitary vowel in Abaza while Saussure believes the Indo-European root vowel to be the one represented as $\partial$ in the analysis proposed here. Lehmann's quite valid proposal (1952:112) to treat the solitary Indo-European vowel as a default feature of syllabicity, due to it having nothing else with which to compare, essentially sets up a vowelless analysis of Indo-European to which Kuipers' study (1960) of another Northwest Caucasian language, Kabardian, provides an interesting comparison.

### 8.2.2.2 Kabardian

In his $\partial / a$ analysis of Kabardian, Kuipers (1960:50-1) takes Allen's approach one step further by suggesting that the vowel $a$ should be reanalysed as a feature of openness rather than a vowel due to it having no other vocalic elements with which to compare. Halle, who is accepting (1970:99) of Kuipers' a/a analysis, dismisses both the analyses of a by Allen and Kuipers as well as Kuipers' further analysis of $a$ on the following grounds: the symbols for stress and juncture required to dispense with $\partial$ are

[^171]merely notational distinctions (1970:100-3); ${ }^{513}$ treating $a$ as a specific feature instead of a vowel represents a terminological readjustment that could be applied to any vowel phoneme (1970:103). Kuipers responds accordingly: if $a$ is predictable in environments that are unequivocally identifiable as stress and juncture then marking an underlying a violates basic phonemic principles (1976:106-7;111-2;114); the feature openness, unlike closeness which is dependent on its position in the word, always yields a phonetic vowel but this is not valid grounds for establishing a consonant-vowel distinction (1976:119-20). In purely synchronic terms, Kuipers' response seems justified, but the special treatment that must be accorded to $a$ could have been more persuasively critiqued by Halle had he appealed to diachronic evidence. In this regard, although Szemerényi's denunciation (1967:75-9) of Kuipers on typological grounds is countered by Kuipers' response (1968:74-7) that this represents a confusion of the phonetic with the phonemic and a lack of familiarity with Northwest Caucasian languages, Szemerényi's observation (1967:81) that the $a / a$ systems proposed for Indo-European and Kabardian are fundamentally incomparable is valid. ${ }^{514}$ While Kuipers' vowelless analysis, upon which Pulleyblank's similar proposal (1984a:57, 1984b) for Mandarin is based, superficially appears to parallel the Indo-European evidence, this cannot be projected back to the Indo-European level where $a$ is an apophonic derivative of a that cannot be compared with $j$ and $w$ due to it being able to function as a syllabic base like $\boldsymbol{2}$; this differs from Kuipers' and Pulleyblank's synchronic analyses of Kabardian and Mandarin respectively where $a$ is allowed to pattern as a feature of openness in the same way that $j$ and $w$ pattern as features of palatility and labiality that only become vocalised when occupying the requisite slot in the syllable. ${ }^{515}$ A similar situation exists in the Sino-Tibetan reconstruction proposed here where $a$ and $a$, albeit with the former being underlyingly zero, represent the two basic building blocks for the syllable.

[^172]
### 8.2.3 Indo-European versus Sino-Tibetan

Pulleyblank (1965b:95-8) proposes a controversial alternative approach by treating Indo-European $a$ as a phonemic vowel with an originally defined morphological function rather than a result of undefined phonetic conditioning with secondary semantic differentiation. However, in addition to Szemerényi's querying (1967:83-4) of the semantic grounds for the $\quad / a$ alternation, Pulleyblank himself (1965b:98) notes the inherent paradox whereby if $a$ is originally zero then the vowel $a$ would have existed phonemically beforehand. Following his proposals for Old Chinese (1986a:9, 1989:8-14), Pulleyblank (1993b:79-82) attempts to resolve the paradox by suggesting the $a$ vowel to be a product of infixation rather than a derived ablaut. Pulleyblank's proposal is interesting but not conclusive even for Old Chinese; when transferred to Indo-European, Lehmann's criticism (1993:119-120) that supposed external parallels do not remove the need for solid internal reconstruction based on Indo-European evidence becomes all the more pertinent. Consequently, although the Sino-Tibetan and Indo-European evidence provides good support for a theory of $\partial / a$ as the underlying vocalic structure of language that is still manifested at the phonemic level in several languages around the world, at this stage of knowledge it can only tantalizingly hint at a complete rejection of the consonant/vowel distinction that will hopefully be achieved with further advancements in the field.

1957－72 小屯第二本：殷虚文字：丙編 Xiaotun Dierben：Yinxu Wenzi：Bingbian （3 volumes）．Taipei：Academia Sinica．

[^0]:    ${ }^{1}$ Pulleyblank's final -ă and -ă glides are both written as -a.

[^1]:    ${ }^{2}$ Matisoff (2003) includes a large majority of these forms which are mostly restricted to Mizo.
    ${ }^{3}$ These have been standardised in notation according to the principles discussed above. Variant forms not relevant to this work are omitted for simplicity.
    ${ }^{4}$ See Miller (1988) and Beckwith (2002a) for dissenting views.
    ${ }^{5}$ See Handel (2008) for further discussion.

[^2]:    ${ }^{6}$ See the discussion in 2.2.

[^3]:    ${ }^{7}$ Sun (1982:286-91) shows that the few instances of distinctive vowel length in other Tibeto-Burman languages are marginal or secondarily derived.
    ${ }^{8}$ The traditional date for the earliest inscription is 1112-3 AD. Duroiselle (1913:1-2) notes a few inscriptions prior to this date but cautions (1921:v-vi) that due care must be applied in ascertaining the originality of many of these. Luce \& Pe Maung Tin (1933-56:I.4;:II:4-5;IV:8-10) are even more discerning than Duroiselle, although Luce (1969-70:I.96) does recognise that some undated inscriptions may well have an earlier provenance.
    ${ }^{9}$ Old Chinese is traditionally reconstructed back to the time of the Shijing book of poetry compiled between 1000-600 BC. Palaeographical evidence in the earliest Chinese inscriptions takes this back two centuries earlier.

[^4]:    ${ }^{10}$ Lehman (1979:1-2, 1992b:62) rejects an exonymic source and prefers to derive the name from a Southern Chin word meaning person $n$ which he suggests was co-opted into Burmese; the viability of this proposal is beyond the scope of this work.
    ${ }^{11}$ A hyphenated form Kuki-Chin is often found; this is somewhat tautological and the term Chin is exclusively used here due to its Burma-specific focus.
    ${ }^{12}$ See Luce (1985:I.94-5) for a suggestion that this may refer to the Mru ethnic group.
    ${ }^{13}$ Based on an original translation by Luce (1959a:25).
    ${ }^{14}$ Inscriptional evidence only supports medial $j$ - in the word for companion, ally $n$; the confusion of $-l$ with $-j$ - in Old Burmese does not rule out the possibility of a medial $-l$ - but the uniqueness of forms in -$j$-makes this unlikely.

[^5]:    ${ }^{15}$ Luce \& Pe Maung Tin (1933:4) question the originality of this inscription and Luce (1962a:65) suggests it to be an early copy. Nevertheless, solid evidence for a medial $-l$ - is found elsewhere in the
     Old Burmese rendition of Written Burmese pupp garden $n$ that is noted by Hla Pe (1960:79) to be a Pali loanword.
    ${ }^{16}$ Luce (1985:I.77) translates this literally as Hole of the Chins; Matisoff (1989:600) suggests Wellspring of the Chins may be a nicer turn-of-phrase.
    ${ }^{17}$ Bradley actually divides this between 150,000 for his Northern Chin group and 400,000 for his Central Chin group.

[^6]:    ${ }^{18}$ The language Khualsim, as surveyed by Luce (1959a:22, 1962a), may also be included here. See Lehman (1963:105) for a brief comment on the linguistic situation in and around Falam.
    ${ }^{19}$ Luce's vowel $\hat{o}$ equates with the Thado diphthong oo discussed in 1.4.1 below.

[^7]:    ${ }^{20}$ The Pau Chin Hau movement with its related orthography is described in Bennison (1933:194-5;2178). From personal discussions with a few remaining practitioners of the belief-system, it appears the original logographic script, unavailable to Bennison, is still used in the oral recitation of learned texts but never fully developed an established system of marking all the necessary distinctions. By contrast, the later syllabic variant, discussed in more detail by Bennison, appears to systematically extend down to the marking of non-phonemic surface differences but the unwieldiness that this entails has no doubt led to its ousting by the romanised missionary orthography leaving it to be now preserved more for the sake of tradition than out of any functional purpose.

[^8]:    ${ }^{21}$ In particular Matisoff (2003) and Peiros \& Starostin (1996).
    ${ }^{22}$ See the discussion below.
    ${ }^{23}$ Syntactic analyses of Northern Chin are naturally much more reliable than phonological descriptions; see footnote 444 for some examples.

[^9]:    ${ }^{24}$ Sandhi altered binomial forms are noted in the data-set as such. A thorough analysis of tone sandhi is beyond the scope of this work; a brief discussion may be found in Luce (1962a:11) with more detailed analyses for Sizang by Stern (1963:230-3), Tedim by Henderson (1965:13-4;34-9), Mizo by Weidert (1975:53-6) and Zahau by Osburne (1979:183). See also the discussion of the Sizang high tone in 1.6.1. ${ }^{25}$ Henderson's typed introduction (1962), as well as her preface to Luce's contribution, may be found in the collection of her papers at the School of Oriental and African Studies in London.
    ${ }^{26}$ A small selection of it may be found in Luce (1985:I.82-6;II.70-87); the complete work may be found in the collection of Luce's papers at the National Library of Australia.
    ${ }^{27}$ The only published comparative study of several languages is Ohno (1965) but this is limited to written forms and only the first part on initials ever appeared.

[^10]:    ${ }^{28}$ This concomitantly renders such unstressed syllables unable to bear distinctive tone.

[^11]:    ${ }^{29}$ The diphthong $\varepsilon a$ is not noted by Stern (1963) but is noted in table A of Luce (1962a).

[^12]:    ${ }^{30}$ There is an exceptional case in the word for froth $v i$ in Thado and Zo where the change does not appear to occur.
    ${ }^{31}$ This surface realisation is supported by Luce (1962a:60, 1985:II. 70-87) who writes [2u].
    ${ }^{32}$ The words sift $v t$ and snap $v t$ are both inflected forms.

[^13]:    ${ }^{33}$ These cases are not addressed in the work here; see Henderson (1965:94) and Bhaskararao (1989:110) and for a discussion of the special phonological characteristics of adverbs in Tedim.
    ${ }^{34}$ Zahau ${ }^{\text {h moj" }}$ " visage $n$ reflects the regular unstressed vowel.
    ${ }^{35}$ A transcription of -ow would concur better with the other three diphthongs with syllabic weight on the vowel rather than the coda, but the discussion of the Zahau surface articulation in 1.4.2.1 suggests $-o w$ to be more appropriate
    ${ }^{36}$ Two Zahau words, $? \varepsilon \mathrm{j}^{\mathrm{i}} \sim$ ? $\varepsilon \mathrm{j}^{\mathrm{III}}$ eat $v i$ and $\mathrm{k} \varepsilon \mathrm{j}^{\mathrm{i}}$ In, have variants $\mathrm{id}^{1} \sim 2 \mathrm{i}^{\mathrm{II}}$ and $\mathrm{ki}^{1}$ respectively.
    ${ }^{37}$ The exceptional case of Zo voj- elephant $n$ is also irregular in its initial in Sizang and is treated as an Austroasiatic loanword in 6.5.4.

[^14]:    ${ }^{38}$ If length rather than syllable weight were being marked, this could be distinguished as [:] and [r] after the vowel.
    ${ }^{39}$ This change renders it homophonous with the uninflected Thado word p $₹$ f flat vi.
    ${ }^{40}$ The glottal coda in Thado and Zo is wholly unrelated to that of Mizo, Zahau and Tedim; Sizang does not attest a glottal coda.

[^15]:    ${ }^{41}$ There are a few exceptions in the data-set which appear to provide a rare opportunity to clearly isolate inter-Chin loanwords. A good example is Zo nal' nose $n$ which should regularly correspond to Mizo ${ }^{\text {n }}$ nar' as na' but is most likely a late loan in place of the more commonly used binome nepkoo ${ }^{\text {II }}$ nose $n$ literally meaning snot burrow $n$.
    ${ }^{42}$ When uttered in isolation, there is a very faint glottalic constriction in Zo tone II syllables which makes them difficult to distinguish from a slightly more clearly articulated glotal coda.

[^16]:    ${ }^{43}$ This may also be extended to the lateral plosives $t^{\prime}$ - and $t^{t h}$ -

[^17]:    ${ }^{44}$ Notably there are also a select few cases of $x$ - being articulated as $k^{h}$-; whether this represents dialect confusion or shift is unclear and only the transcription $x$ - is used in the data-set.
    ${ }^{45}$ There are two words where Sizang reflects $v$-before $u$ : vot ash $n$ and the song word voj'saj' elephant $n$; the irregular Tedim vocalism vot for the former suggests a possible external source but it could just be a case of sporadic euphonic ablaut as discussed in 7.5.2.2; the latter has irregular syllable weight in Zo and is treated as an Austroasiatic loanword in 6.5.4.

[^18]:    ${ }^{46}$ It is equally applicable to Sizang.

[^19]:    ${ }^{47}$ The curious phonology of adverbs was noted in footnote 33.
    ${ }^{48}$ It is perhaps of relevance that the Tedim form, unlike the Sizang form, does not inflect. However the failure of other morphemes to always exploit their inflectional potential due to the gradual reduction of inflections across all the languages makes this an unreliable indicator of anything being amiss.

[^20]:    ${ }^{49}$ Common variant forms are shown in parentheses; the rhyme $o \sigma-\infty /-\delta-a w$ is often also found as $\sigma_{-}$ ${ }_{2} \delta$ in the inscriptions.

[^21]:    ${ }^{50}$ The former two pronunciations generally reflect reading and colloquial pronunciations respectively. Regarding the latter, Nishi (1974:26, 1999:667) observes that it is confined to a handful of grammatical
     $a n$ although their modern pronunciations reflect $-\infty-a j$.
    ${ }^{51}$ Jones notes, but does not distinguish, a further pronunciation of $-a n-\mathfrak{z}$ as $-\tau$ which is homophonons with the modern pronunciation of $-\varepsilon-a y$ and is now orthographically distinguished in Written Burmese as - $\{$. Bradley (1985:194) attributes this mainly to loanwords, but it is actually a standard development from the palatalisation of $-n$ by palatal medials as will be discussed below.
    ${ }_{53}^{52}$ Maran (1971:40-1) makes a similar claim.
    ${ }^{53}$ This is still accepted by Matisoff ( $2003: 286 ; 361$ ).

[^22]:    
    ${ }^{55}$ Benedict＇s comparison of fu＇II 腹 puwk＜＊＇pok ${ }^{\text {w }}$ stomach $n$ and fu ${ }^{\text {II }}$ 复 $\mathrm{p}^{\mathrm{h}} \mathrm{uwk}$＜＊＇h pok ${ }^{\mathrm{w}}$ cave $n$ with this Mizo form is possible．
    ${ }_{57}^{56}$ Medial－$w$－may not occur before a－$w$ coda．
    ${ }^{57}$ Pulleyblank also suggests that the variant form $\mathfrak{f}$ of the initial creaky tone vowel $\mathrm{e} u^{I I I}$ ，as well as its regular tone form of ${ }^{\dot{L}}{ }^{\circ} u^{\prime}$ ，in which the vowel $u^{\prime \prime \prime}$ is surmounted by creaky $\underline{o}^{\circ} i^{\prime \prime \prime}$ or regular tone $-i^{\prime}$ ，is evidence for the vowel $u$ having been treated as a complex sound wi or $u i$ at the time of orthographic establishment．However，inscriptional evidence supports Shorto＇s suggestion，noted in Pulleyblank，that its modern form is due to script standardisation rather than any phonological motivation．Furthermore，

[^23]:    although Pulleyblank notes that these forms are not found in Mon, the corresponding form in other Indic scripts shows no evidence of a superscript $i$ vowel.
    ${ }^{58}$ The date cited by Bradley presumably refers to an unrelated Burmese tribute that, according to Miller, was made to the Chinese court in 1451. Miller (1954:371-2) suggests the Sino-Burmese vocabulary dates from works made sometime in the $16^{\text {th }}$ century but notes that the compiler was born in 1649 and the preface to the work to which it is attached is dated 1683.
    ${ }^{59}$ Hla Pe (1960:93) notes that the transcriptions indicate that -2. appears to have already lost its nasality.

[^24]:    ${ }^{60}$ The debate stems from as early as Blagden (1914:138) and Wolfenden (1929:197) through to Dempsey (2001:206-15) who essentially follows Jones' lead.
    ${ }^{61}$ Nishi's response to this (1999:678) may be taken as representative of the general field of linguistics where current dogma dictates that all vowel systems must be triangular.

[^25]:    ${ }^{62}$ See the discussion in 5.1.2.
    ${ }^{63}$ There is one case where the medial $-u$ - appears to be lacking but Nishi suggests this to be due to a problem of space on the inscription rather than through any phonological motivation.
     provenance, which still remains unclear since Blagden's (1916b:28) and Taw Sein Ko's (1915:97) discussion, is most likely from an external source.

[^26]:    ${ }^{65}$ For simplicity, the Sino-Tibetan rhotic *-r is not included in this chart due to its dialectal variation discussed in $5 \cdot 2.4$. Northern Chin and Chinese cognate sets have not been found in the following chapters to account for all of these changes which are assumed on the basis of structural symmetry alone; it is hoped they will be confirmed by further research. Medial $-j$ - is not noted before $a$ because it is retained as part of the initial complex in Burmese without fusing with the rhyme as it did before $\partial$; see the discussion below. Along with medial $-w$ before labialised codas, medial $-j$ - is similarly indistinct before palatalised codas.
    ${ }^{66}$ The rhyme *-wal would be expected by analogy with ${ }^{*}$-al but this appears to merge with ${ }^{*}$-waj instead as paralleled by the merger of *.(w)al with *-(w)aj. A discussion of Old Burmese -wi and its corresponding form in Northern Chin is found in 5.2.3.1.

[^27]:    ${ }^{67}$ The distinctive case of $-\mathfrak{ఇ}^{〔}-a n$ was discussed above. Nevertheless, the nasal counterpart ${ }_{\square}^{\circ} \varepsilon$ has merged with secondary palatalised $-n$ codas now represented as $-\hat{\ell}$; see the discussion below.
    ${ }^{68}$ See also Benedict (1972a:21-2).
    ${ }^{69}$ The latter is typologically very unusual and in many varieties of modern spoken Burmese is not distinguished.
    ${ }^{70}$ This is commonly realised as a dental affricate $\overparen{\theta} \theta$.
    ${ }^{71}$ The time of the merger of all obstruent codas to a glottal stop and the reduction of all nasal codas to nasalisation of the preceding vowel most likely occurred around the same time; Pe Maung Tin (1922:130) suggests it to have occurred later than the above changes but Yanson (2006:119) suggests sometime around the middle of the $18^{\text {lh }}$ century.

[^28]:    ${ }^{72}$ The medials $-j$－and $-w$－are not retained in syllables with $\partial$ vocalism due to them merging according to the principles discussed in 2．1．4．

[^29]:    ${ }^{73}$ Unfortunately no comparative sets with -jwa in Old Burmese or Old Chinese have been found so it remains unclear whether in Northern Chin the palatal or labial element dominated. ${ }^{74}$ The Pali origin is supported in Hla Pe (1960:89).

[^30]:    ${ }^{75}$ Yanson notes Hla Pe's suggestion (1967a:75) that it is a Mon loanword from the $15^{\text {th }}$ century but misreads him to assume that it is not attested in Mon before the $15^{\text {th }}$ century; on this basis Yanson suggests it must be a Burmese loanword into Mon. Peiros (1997:245) supports Hla Pe's suggestion for an external source.
    ${ }^{76}$ In an interesting development, original Sino-Tibetan -ja- which gave Old Burmese vocalic -i- was left without the palatal force to palatalise dental codas between Inscriptional Burmese and Written Burmese while -ja-, which retained the palatal, was able to do so.
    ${ }^{77} \mathrm{Hla} \mathrm{Pe}$ (1960:92-3) observes that there is frequent interchange between $-£$ and - $\oint$ in Pali loanwords supporting the nasalised evolution of the former.

[^31]:    ${ }^{78}$ See also the discussion under Red (\#205).
    ${ }^{79}$ See Luce (1959c:68-9) and Yanson (2002c) for further discussion.

[^32]:    ${ }^{80}$ See the discussion in 6.4 regarding the association of tones I and II.
    ${ }^{81}$ Benedict (1972a:111) notes an apparent confusion between bilabial obstruent and sonorant prefixes in Tibeto-Burman. Although this perhaps helps to account for why there is no evidence for velar nasal clusters in Old Burmese native words, the clear distinction between $p$ - and $m$ - in Burmese remains unexplained.
    ${ }^{82}$ See Okell (1971:15-20) and Nishi (1977:44-7) for a discussion of some exceptional cases.

[^33]:    ${ }^{83}$ See also the suggestion under Village (\#45) that $-h$ is occasionally attested in Mon loanwords into Burmese as an inscriptional artefact.

[^34]:    ${ }^{84}$ To his credit, Thurgood acknowledges this difficulty and suggests that while some instances may well derive from $-s$, there is a lack of evidence (1981:49-50;56).

[^35]:    ${ }^{85}$ Usually used to mean flush $v i$ in reference to the spreading of blood in the face.

[^36]:    ${ }^{86}$ See Baxter (1992:32-43;139-74) for a good summary of the historical development of this field.
    ${ }^{87}$ See the discussion in 3.5.2.

[^37]:    ${ }^{88}$ It also occasionally correlates with Bodman's $\partial$ as will be discussed below.
    ${ }^{89}$ The plain vowels in Baxter's and Li's systems do not correlate before velars, including where Li reconstructs $-g$ where Baxter has an open vowel; this is discussed further below in 3.2.3.
    ${ }^{90}$ See the discussion in Baxter (1992:255).

[^38]:    ${ }^{91}$ Pulleyblank (1977-8:200-2, 1993a:366-8) prefers to assume that the medial $-w$-, when not from an original labiovelar initial, occurred via the addition of dental suffixes to syllables ending in rounded glides causing metathesis of the glide with the vocalic nucleus. Although this seems to have occurred in certain cases, it is unlikely that an account for all cases of medial $-w$ - may be made in this manner.
    ${ }^{92}$ Baxter actually writes $\partial$ as $\dot{i}$ which is carried through to Baxter (1994a:26); Baxter (1995), a published summary of which may be found in Matisoff (1995:36), reverts back to $\partial$.
    ${ }^{3 / 3}$ See Benedict (1972a:183-4; 1973b:9) and the discussion in 5.1.2.
    ${ }^{94}$ This will be further discussed in 8.2.
    ${ }^{95}$ Pulleyblank also reconstructs uvular codas but more recently (1991a:44-51) replaces these with labiovelars to then replace the original labiovelars with labiopalatals; for the reasons outlined below these modifications will not be adopted in the system used here.
    ${ }^{96}$ The possibility of a a/a vowel system for Old Chinese is first proposed in Puileyblank (1963:207).
    ${ }^{97}$ Pulleyblank (1993a:370, 2004:153) suggests another cause of this may be a palatalising sibilant prefix as discussed under Extinguish (\#50).

[^39]:    ${ }^{98}$ The distinction of medial－w－before labiovelar codas encounters the same problems as with Pulleyblank＇s medial－j－before palatal codas．This issue is beyond the scope of this paper but see the discussion under Extinguish（\＃50）for some preliminary observations．Medial－w－is not distinctive after bilabial initials in Old Chinese．
    ${ }^{99}$ See the discussion in 3．5．1 and 4．10．2．
    ${ }^{100}$ The Shijing rhymes suggest that suffixal－s after－at persisted longer than after other rhymes；see the discussion below．
    ${ }^{101}$ Pulleyblank actually reconstructs $-\gamma$ but later（1995c：298）modifies the coda to $-u_{l}$ which may not always have been present；see the discussion below．

[^40]:    ${ }^{102}$ Phonologically related words sharing the same phonetic component in their graphic form.
    ${ }^{103}$ Interestingly Peiros' discussion (1998:215) of the distinction between $-t$ and $-l$ codas in the SinoTibetan system of Peiros \& Starostin (1996) actually favours Pulleyblank's distinction of $-n$ and $-l$ rather than Starostin's $-n$ and $-j$; see the discussion in 5.2.4.
    ${ }^{104}$ Baxter (2005b:9-21) further develops the evidence for this dialect shift of $-r$ by locating the dialectal differences to specific regions

[^41]:    ${ }^{105}$ Pulleyblank（1984a：119）treats these as Middle Chinese $-j 0$ and $-j k$ rather than actual palatals on the basis（1977－8：188，1979：29）that $-n$ and $-c$ were retracted to velar articulations after the low $a$ vowel． Pulleyblank（1991a：47）modifies his Old Chinese reconstructions of $-\eta$ and $-c$ to $-\eta^{j}$ and $-k^{j}$ which is shown in 5.2 .5 to account better for the Old Burmese and Northern Chin evidence．In the reconstructions used here，Pulleyblank＇s original $-n$ and $-c$ will be retained for Old Chinese while $-\eta^{j}$ and $-k^{j}$ will be used for Sino－Tibetan；this represents more of a transcriptional convention than any phonological statement on the difference between the two．
     as phonetic，rhymes as＊m－rəə ${ }^{111}$ in the Shijing；Pulleyblank＇s $-a n$ and $-\partial n$ correspond to $-i \eta$ and $-i n$ in Li＇s system which allows Li to suggest a sporadic and isolated dialectal shift of－ig to－in．Baxter＇s reconstruction of－en for the former and－in for the latter forces him to assume that $-i \eta>-i n$ in the Shijing dialect but $-i \eta>-e \eta$ in the dialect later represented by the Qieyun；this is not felicitous and contradicts the Tibeto－Burman evidence that he uses to suggest－in $>$－in in both the dialect represented by the Shijing and the predecessor of the Qieyun．

[^42]:    ${ }^{107} \mathrm{Li}$ uses these voiced codas more as a functional notation than as an actual reconstruction. However, scholars like Gong (1995:57-9) attempt to assign a phonological reality to them. A detailed analysis of all the facets of the argument may be found in LaPolla (1994:135-154).
     Pulleyblank (1991a:59) show $-p^{118}(-p-s)$ to have merged with $-t^{\text {III }}(-t-s)$ well before the time of the Shijing.
    ${ }^{109}$ It is noted above that the Shijng rhyming shows $-s$ to have persisted after $-t$ longer than after other codas.

[^43]:    ${ }^{110}$ Pulleyblank (1977-8:197-9) reconstructs -ax for the corresponding yin glide treated by Baxter as -aw and Li as $-a g^{\text {w }}$ which will be further discussed below.
    ${ }^{111}$ The voiced labiovelar $-g^{w}$ is based on the voiced coda hypothesis discussed in 3.2.3.
    ${ }^{112}$ Baxter (1992:533) suggests the exceptional cases where a $-w k$ coda as opposed to a $-k$ coda develops in Middle Chinese may be due to dialect mixture where delabialisation of his $-k^{w}$ did not occur. If the rhyme is to be reconstructed with an uvular -aq then it must conversely be assumed that labialialisation occurred in these dialects; this is perhaps associated with the labialisation attested in the corresponding yin rhyme although further investigation may show Sagart's reconstruction (2007:1-2) of labio-uvulars in initial position to have a bearing on this if they can correspondingly occur in coda position.
    ${ }^{113}$ Although the intermediary form - $a \beta$ is supported by Pulleyblank's suggestion (1963:206) that it is attested in foreign transcriptions, his phonological explanation for the change $-a s>-a \beta>-a w$ on the basis of the occasional change of Middle English $-\chi$ to modern English $-f$ ignores the fact that the labiodentalisation was restricted in English to words with a preceding labial $u$ vowel. Nevertheless, an association of labialisation with back articulations may be found in the change in Cockney English of the velarised/pharyngealised $-\mathbb{q}$ into $-w$.
    ${ }^{114}$ Pulleyblank (1991a:47) abandons his uvular hypothesis to instead adopt Baxter's reconstruction of $-a w$ and $-a k^{\prime \prime}$ and concomitantly replaces his original $-a w,-a \eta^{\prime \prime},-a k^{w}$ with $-a u,-a \eta^{4},-a k^{4}$. As Vovin (1995:324-5) observes, when combined with the plain velars and labiovelars and palatovelars, this

[^44]:    creates a four-way distinction of velars in a system which, albeit perfectly distributed symmetrically, is not well distributed articulatorilly. With the recent reinvigoration of the reality of uvulars in Old Chinese, it seems wiser to retain Pulleyblank's original proposal.
    ${ }^{115}$ The late development of the Mandarin Chinese tone Ib category from different manner features of initials is discussed in Pulleyblank (1978a:192).
    ${ }^{116}$ Benedict's proposal (1972b:27) to treat it as a sandhi phenomenon is discussed in footnote 323. Pulleyblank's modification (1995a:160, 1995b:30) of $-s$ to $-\int$ is not adopted here due to it being predicated on a reconstruction of Old Chinese initials not adopted here; see the discussion of initials below.

[^45]:    ${ }^{117}$ This may be the source of the sporadic etyma in Downer's latter categories.

[^46]:    ${ }^{118}$ Palatal spellers also occur in the fourth division in what are known as chongniu characters; see the discussion in Pulleyblank (1984a:173-4).
    ${ }^{119}$ The A/B terminology follows Pulleyblank (1994a:73).
    ${ }^{120}$ Baxter's later rejection (2005a:41, 2005b:7) of this is discussed below.
    ${ }^{121}$ The short vowel in the data-set here is confirmed in Table A of Luce (1962a).

[^47]:    ${ }^{122}$ Norman actually proposes pharyngealisation as a blocker of palatalisation in Type A syllables. See Pulleyblank (1996a) for a response which criticises Norman's rather contradictory assumption that retroflexion could also block palatalisation in Type A syllables but not in Type B syllables.
    ${ }^{123}$ Notably words with diphthongs and open rhymes develop a tone II reflex in form 2 contrary to their expected tone III reflex due to their inherent length; see the discussion in 7.1.

[^48]:    ${ }^{124}$ See the discussion in 4.10.2.
    ${ }^{125}$ Sagart's transcription of this as $h$ - follows Baxter (1992:58) who notes that it actually has a voiced articulation of $f$ - or $\gamma$-.
    ${ }^{126}$ Sagart (2007:3) assumes that velars developed from uvulars when preceded by a lost iambic prefix of some kind.
    ${ }^{127}$ The lack of a voiced counterpart to $x$ - is discussed in Sagart's response (1999b:30) to the proposals in Baxter (1992:209-10). Schuessler (2007) follows Pulleyblank's original proposal (1962:143) to reconstruct $h$-, although Pulleyblank (1991a:57-8) prefers $x$-. Unfortunately no good Tibeto-Burman comparative sets have been found.

[^49]:    ${ }^{128}$ Sagart's proposal is bolstered by Norman's suggestion (1986:383-4) that pre-syllables may have affected the development of Min Chinese initials which Sagart (1999b:26) believes may be directly correlated with iambic prefixation.
    ${ }^{129}$ Sagart distinguishes these as $k-l / r$ and $k z-l / r$ - in order to distinguish cases of infixal $-r$ - which he treats as $k r$-; in the system here, Sagart's infixal $-r$ - is treated as a prefix and the transcriptions $k l-/ k r$ and $k-l-k-r$ - will be used to correlate with the Northern Chinese evidence discussed in 4.2.
    ${ }^{130}$ He further suggests (1999b:129) that iambic prefixes could be lost early before $l$-in which case the Middle Chinese reflex would represent the ordinary development of Old Chinese $l$ - into Middle Chinese $d-/ j$-.

[^50]:    ${ }^{131}$ This is a development of an original proposal by Schuessler (1974b:189-91) that complex prefixal clusters of two or more elements in Written Tibetan provoked the loss of medial $r$; a broader scan of the Written Tibetan evidence suggests this not to be the case.
    ${ }^{132}$ This of course rekindles the discussion over whether obstruent prefixes were originally voiced as a literal interpretation of the Written Tibetan orthography would suggest and Matisoff (1972a:33-7;55-6) would like to suppose in order to account for occasional unexpected tonal developments in Loloish, or whether they were voiceless as Bodman (1980:73) notes the Old Chinese evidence to suggest.

[^51]:    ${ }^{133}$ Matisoff's revision of his previous Lolo-Burmese voiced initials (1968:887-8) to pre-nasalised initials (1972a:15) may perhaps be open to the same criticism as Sagart's Old Chinese pre-nasalised initials but this is beyond the scope of this paper.

[^52]:    ${ }^{134}$ Benedict suggests that aspiration is conditioned by a voiceless obstruent being unprefixed in initial position.
    ${ }^{135}$ Contrary to Benedict's suggestion (1972a:106) that it may trigger aspiration like the causative $s$ prefix, the appearance of the animal prefix $s$ - before words with aspirated and unaspirated initials in Northern Chin shows this not to be the case. Benedict's proposal to derive it from a reduced form of the Tibeto-Burman root for Northern Chin ${ }^{\text {saI }}$ meat $n$ is confirmed by the clear association of the avian prefix va- with *wa ${ }^{\text {I }}$ bird $n$ in Northern Chin. In this regard, Luce's suggestion (1959a:30) that these represent later developments in Tibeto-Burman languages not to be reconstructed in the original protosystem seems correct.

[^53]:    ${ }^{136}$ This refers to Type A syllables; in Type B syllables it remained as $g$-.
    ${ }^{137}$ See Chambers \& Trudgill (1980:187-9).

[^54]:    ${ }^{138}$ Not attested in the inscriptions.
     $\mathrm{k}^{\mathrm{h}}: \mathrm{j}^{\mathrm{n}}$ sac leopard $n$, in which the latter syllable means leopard $n$ by itself, with Mizo kej ${ }^{\text {f }}$ tiger $n$, but

[^55]:    neither the rhyme nor tone correspond and the syllable also occurs in the Arakanese word
    
    ${ }^{140}$ Excluding eleven cases simply reconstructed with $r$ - with no comment regarding a prefixal or cluster and one irregular root, twenty of the twenty-two cases are derived from clusters while two are assigned prefixal origins.
    ${ }^{141}$ The proposal stems back to Starostin's division (1989:217-220, 1995:227) of Old Chinese xiesheng series with laterals into $l-,{ }^{n} l$ - and $\chi$-, $\chi^{h}$-, $E$-, $E^{h}$ - on the basis that, in spite of many commonalities and occasional mixing, Middle Chinese sibilant reflexes are confined to the former and retroflexes to the latter. Sagart (1999b:36-40) shows such a division to be statistically unsound and notes that prefixal/infixal $r-/-r$ - and prefixal $s$ - can adequately account for any such tendencies.
    ${ }^{142}$ Other cases of $T-l$-, which mostly correspond to Starostin's Old Chinese lateral affricates, may generally be treated as $l$ - unless a prefix, like $s$ - or $r$ - in Old Chinese, is warranted from other daughter languages.
    ${ }^{143}$ Perhaps also of note here are the following: *(k)rral' ${ }^{1}$ stripe $v$ for which Mizo and Zahau suggest an
     which Zahau suggests $* k^{(h)}$ - rather than $* k^{(h)} l$ -

[^56]:     rejected under Night $n$（\＃31）．
    ${ }^{145}$ Takashima（2004：3）observes that in spite of the graphic confusion it is unlikely that there is any phonological relationship between these two words．
     rjak day（of 24 hours）$n$ is discrepant in terms of initials．Superficially it seems that this may be supported by Matisoff＇s（2003：323－7）and Peiros \＆Starostin＇s（1996：\＃769）comparison of Mizo＂rrak ${ }^{\text {b }}$
     $n$ ．However，the Burmese word is confined to the second part of compounds and appears to be derived from əje？зฉฉீ ərak distilled liquor n，shown by Hla Pe（1967a：81）and Stewart \＆Dunn（1940－81：303）

[^57]:    to be a Mon loanword ultimately from Arabic, in which the first syllable з a from the Mon source has been reanalysed as a prefix.
    ${ }^{147}$ See Sagart (1999b:79-89) for the Old Chinese evidence.

[^58]:    ${ }^{148}$ Matisoff's comparison (2003:523) of Mizo brak ${ }^{\text {hb }}$ converse vi/t with Burmese pwe? पgoos prwak scold, berate $v t$ tacitly implies that the shift of $p r$ - to $t$-does not occur after voiced initials; this unlikely scenario is discussed further below. In any case, the Mizo word is a form 2 inflection of bia ${ }^{\text {II }}$ with a suffixal $-s$, and the Burmese word has a root meaning effervesce $v i$ from which the above gloss is but a semantic extension; a similar association may be found in Northern Chin *tsar ${ }^{1}$ bubble $\nu$.
    ${ }^{149}$ Peiros \& Starostin (1996:\#670) make a similar semantic proposal by comparing Mizo tey ${ }^{1}$ dry $v i$ with liay ${ }^{\text {lb }}$ 凉 liay $^{\mathrm{t}}<$ *k-ray $^{\mathrm{t}}$ cool vi. A difficulty with the proposal is that the Mizo form is only supported in Zahau where it occurs in tone II as tey ${ }^{\text {Ta }}$.
    ${ }^{150}$ No Mizo or Zahau correlate to Tedim $\mathrm{p}^{\text {thel }}$ [ has been found.
    ${ }^{151}$ There are two other possible cases in the word list: Mizo and Zahau tow' sprout vi appears to correspond to pow' sprout vi elsewhere, yet Mizo also has a form pow? poke out vi, poke into vt which, in the case of the latter gloss, appears to be a transitive derivation of the $p$ - initialled form; Mizo $t^{\mathrm{h}} \varepsilon l$ ? extinguish $v t$ appears to correspond to Tedim $\mathrm{p}^{\mathrm{h}} \varepsilon$ l? extinguish $v t$ yet its sense of separating wood from a burning fire or breaking up a fight/quarrel shows significant semantic overlap with Mizo ${ }^{h}$ ह el? untie, dismantle $v t$.
    ${ }^{152}$ Matisoff (1972a:41, 1988a:688) attempts to associate Mizo tek ${ }^{\text {1b }}$ lightning $n$ with Lolo-Burmese *t(r)ek but the validity of the Lolo-Burmese $-k$ is is questioned by Nishi (1977:9) and acknowledged as a difficulty by Matisoff (2003:374). Matisoff (2003:373-4) modifies the reconstruction to Sino-Tibetan *gle:k on the basis of an Asho Chin form, listed by Luce (1985:II.87) as "gle?", but the lack of an $-r$ phoneme anywhere in Asho, either individually or as a feature of retroflexion, is shown in Stern (1962:11) and Luce (1962a:53). Stern (1962:11), commenting on Löffler's suggestion (1960:548) that medial $r>l$ in loans from Burmese into Asho, suggests that this may be a more general shift in the language as a whole; this supports a reconstruction of Northern Chin *krek ${ }^{11}$. Matisoff's semantically and phonologically tenuous comparison of si? of cac dartingly, tinglingly vi originally had a $-t$ coda as evinced by the inscriptional examples of the verb si? o\& / oof cjat sift, sieve vt from which it is derived.

[^59]:    ${ }^{153}$ There is similarly no evidence for original tr-clusters with Matisoff's tentatively proposed comparison (2003:267;303) of distend vi/t, discussed in 6.5.4, being Mon-Khmer influenced or unrelated.
    ${ }^{154} \mathrm{Hla} \mathrm{Pe}(1960: 80)$ notes this to be a Pali loanword; it specifically refers to the various Jätaka incarnations of the Buddha about which a fuller discussion as it pertains to Inscriptional Burmese may be found in Luce (1956) and Luce \& Whitbread (1971:172-5;200-17).
    ${ }^{155}$ Based on an original translation by Luce \& Whitbread (1971:201).
    ${ }^{156}$ The assimilatory effect of the prefix ${ }_{2} \mathbf{u}^{\text {III }}$, is the source of the modern spoken Burmese voiced initial.
    ${ }^{157}$ The word for horn $n$ also attests an obligatory prefix $2 \mathrm{u}^{\mathrm{II}}$ in the inscriptions; the occasional confusion of $-r$ - and $-j$ - in transmitted texts, discussed by Nishi (1977:46-7), occurs in both dove $n$ and horn $n$ leading them both to be be spelled in Written Burmese with an erroneous $-j$-.

[^60]:    ${ }^{158}$ Northern Chin $* k l$ - and $* k^{h} l$ - are not differentiated in Thado which has ${ }^{h} l$ - for both. In fact all the forms appear to be related, as Solnit suggests, but the alternation of bilabial and velar initials seems to

[^61]:    be due to Mon-Khmer influence rather than due to an intrinsic Northern Chin trait. See the discussion under Fall (\#8).
    ${ }^{159}$ Consequently Matisoff's addition (2003:280) of Mizo thy' complete vi to Benedict's comparison
     $v i$ seems unjustified. Furthermore, Matisoff's extension (1988b:6) of Benedict's comparative set to include pjit ${ }^{1}$ ย廷 pjayr plank $n$, which Benedict (1972a:40) reconstructs under a separate root, is unwarranted due to it being attested with an original -n in the inscriptions as of ${ }^{\text {p }}$ pjan ${ }^{1}$.
    ${ }^{160}$ Possibly also associated are $\mathrm{kkra}^{\mathrm{r} / \mathrm{II}}$ drop $v i$ and ${ }^{*} \mathrm{k}^{\mathrm{h}} \mathrm{rra}^{1 / \mathrm{IIII}}$ drop $v t$ whose tonal issues are discussed under their respective entries in the word list.
    ${ }^{161}$ See Pe Maung Tin \& Luce (1963:62).

[^62]:    ${ }^{162}$ Pe Maung Tin \＆Luce（ $1960: 247$ ）treat this as a gerundive of ke क $\mathrm{kaj}^{\mathrm{j}}$ surpass．
    ${ }^{163}$ Ba Shin（1962：96）notes that $\begin{gathered}\text { q } \\ \text { should read } \\ \text { giq }\end{gathered}$ ．
    ${ }_{164}^{164}$ Based on an original translation by Ba Shin（1962：126－7）．
    ${ }^{165}$ The velar prefix is supported by xiesheng evidence．
    ${ }^{166}$ A comparison of sia $^{\text {iII }}$ 下 yair $^{1 / / I I}<$ gra $^{\text {I／／III }}$ with the Old Burmese forms is proposed in Bodman （ $1980: 145,1985: 155 ; 158$ ）on the basis of his suggestion that Old Chinese $* k l$－，in contrast with $* k-l$ ， merged with $* k r-$ ；this is accepted by Baxter（1992：232）as a change prior to Old Chinese but，although not directly discussed，does not appear to concur with the modifications to Baxter＇s system proposed by Sagart（1999b：122－8）．
    ${ }^{167}$ The function of nasalisation as a means to maintain voicing was discussed in 3．5．2．3．
    ${ }^{168}$ Matisoff＇s（2003：336）and Peiros \＆Starostin＇s（1996：\＃676）comparison of Mizo rep mantel $n$ with
     semantically problematic：the middle syllable ja1 $\eta \delta$／$ๆ \delta$ rjap is noted by Luce（1959b：40）to have a medial $-j$－in its inscriptional form and to have a basic meaning of place $n$ ；the meaning fireplace $n$ of

[^63]:     which compares with son ${ }^{\mathrm{I}}$ 觑／狌 siajy ${ }^{\mathrm{I}}<*^{\mathrm{I}}$ sran ${ }^{\mathrm{I}}$ weasel $n$ casts doubt on Benedict＇s suggestion． Matisoff＇s comparison of Mizo＂lej ${ }^{\text {UI }}$ squirrel $n$ ，with which Shafer（1952：154）suggests a Mon－Khmer link，via a lateral allofam with no nasal coda／suffix is unlikely and its inclusion by Peiros \＆Starostin （1996：\＃1695）under a separate root is preferable．
    ${ }^{172}$ The occasional attestation of ${ }^{h} r$－ 9 －as $h r$－$\omega_{0}$－is discussed in 2．3．2．1 and is of no phonological signficance．
    ${ }^{173}$ This gloss follows Pe Maung Tin \＆Luce（1960：244；255）．
    ${ }^{174}$ Following Yanson（2002a：47，2005：227），this may be functionally treated as a copula in sentence final position．
    ${ }^{175}$ Based on an original translation by Luce（1969－70：2．38）．
    ${ }^{176}$ Of note is an old Written Burmese spelling ayj ${ }^{\text {b }}$ sjay in Stewart \＆Dunn（1940－81：524）．In light of the above，Matisoff＇s（2003：70）and Peiros \＆Starostin＇s（1996：\＃765）comparison with Northern Chin ＊rey ${ }^{1}$ father＇s sister＇s husband $n$ and Shorto＇s（2006：208）tentative Mon－Khmer association are unlikely．

[^64]:    ${ }^{177}$ Shafer (1952:146) suggests a Mon-Khmer link but the the correpondence is poor.
    ${ }^{178}$ Not attested in the inscriptions.

[^65]:    ${ }^{179}$ Pulleyblank (1991a:67) and Sagart (2005:163) support the comparison with the Burmese form above but Pulleyblank (1991a:66-7) and Sagart (2006a:218) further suggest an association with $\underline{1}^{11^{16}}$ 食 zik < *'s-lık eat vi. There may be some kind of word-family relationship but it does not correspond directly to the forms here as the reflex would be Northern Chin lek/lak and Old Burmese lak. A medial $-j$ - could be reconstructed in the Old Chinese form ${ }^{\text {s }}$ - 1 lj jk without disrupting the vocalism but this would give Northern Chin lik/lik and Old Burmese lik. Sagart (2005:163) also proposes an Austronesian link which seems preferable to Shafer's (1952:138) possible Mon-Khmer link.
    ${ }^{180}$ The palatal feature of the coda would of course remain in the same way as if the suffix had been -s. The specificities regarding this proposal are still unclear but Baxter (1992:182) provides some interesting internal evidence further discussed in 3.3.2. Baxter \& Sagart (1997:59-60) add an alternative suggestion that in some cases -? may just be a weakened form of $-k$ conditioned by stress or suffixes no longer evinced.

[^66]:    ${ }^{181}$ Benedict (1972a:18) also derives it from a voiced sibilant $z$ - but his correspondence sets for this phoneme are dubious. Just as Sagart (1999:29-30) shows it to be unnecessary for Old Chinese, it seems unlikely that a voiced sibilant $z$ - is required in Sino-Tibetan. Matisoff (2003:43) suggests that *dz-may give Mizo 15 - or $f$ - indiscriminately but his addition of $t 5$ - appears to be unnecessary.
    ${ }^{182}$ A lack of awareness of the merger of Mizo and Zahau ts- and $f$ - with coronal $t$ - in Zo, Tedim and Sizang can lead to miscomparisons: Matisoff (1988b:4) and Peiros \& Starostin (1996:\#1026) compare Tedim tem ${ }^{1}$ level $v i$ with Burmese tam ${ }^{1}$ os $\operatorname{tam}^{1}$ rod-like object $n$ but Mizo tsem ${ }^{1}$ shows the original initial to have been ${ }^{*}$ s-. Matisoff (1988b:4-7) further associates Tedim dim ${ }^{\mathbb{I}}$ full $v i$ but semantic issues, for which Matisoff (1988b:9) attempts to make a debateable but plausible account on the basis of IndoEuropean, aside, the phonological discrepany is further compounded by the establishment of ${ }^{*} / 5$ - rather than ${ }^{*}$ t-for level vi.

[^67]:    ${ }^{183}$ In spite of Matisoff＇s response（1995：42－3），Baxter＇s rejection（1994a：28－9）on phonological and semantic grounds of Matisoff＇s comparison（1988b：10－13）of Tedim and Mizo saj＇elephant $n$ and Mizo zajil＇ temperament $n$ with tsail ${ }^{\text {ib }}$ 才／財／材 dzaj ${ }^{1}<{ }^{*}{ }^{\text {ja }}{ }^{1}$ material，talent $n$ is justified．
    ${ }^{184}$ Matisoff＇s comparison（2003：251）of sã̃ $\dot{\text { i }} \operatorname{cam}^{\mathrm{I}}$ enjoy，benefit from vt with Mizo tsam ${ }^{\mathrm{I}}$ sojourn vi via a gloss of stay（of royalty）$v i$ is tonologically and segmentally acceptable but Stewart \＆Dunn（1940－ 81：84）show Matisoff＇s gloss to be only applicable in compounds with nã̃ ${ }^{1} \& \dot{\&}: \operatorname{nan}^{11}$ palace $n$ ．
    ${ }^{185}$ No Old Chinese comparanda have been found but the correspondence with $c-/ /$－may be made on the basis of it being the only remaining，and most logical，slot in the system．
    ${ }^{186}$ Matisoff suggests that Lai Chin dop suck $v t$ is related as a stop－initialled allofam，but Sizang，whose reflex of＊＊op ${ }^{11}$ is the regular top ${ }^{\mathrm{I}}$ ，also has a word dup ${ }^{\mathrm{T}}$ suck out directly（e．g．from an egg）$v t$ which compares much more favourably to the Lai form．

[^68]:    ${ }^{187}$ More specifically in Benedict's system this corresponds to ${ }^{*}$ - which is aspirated by default in initial position. The requirement for distinctive aspiration in accounting for the Northern Chin affricate series casts serious doubt on Benedict's proposal to distinguish initial consonants via voicing rather than aspiration.
    ${ }_{188}$ They actually cite the correct spelling under a separate root (1996:\#1321).

[^69]:    ${ }^{189}$ Not in the inscriptions．
    ${ }^{190}$ See Sagart（2004：71－2）for a justification of this analysis in the Shuowen．
    ${ }^{191}$ The graphic composition may have occurred between Old and Middle Chinese when the divergent Old Chinese rhymes had become very similar；after grave initials the Old Chinese rhyme＊－əl actually gives the same Early Middle Chinese reflex $-\partial j$ as Old Chinese ${ }^{*}-\partial(1 u)$ ．

[^70]:    ${ }^{192}$ Benedict's only other correspondence, with the medial $-j$ - tentatively enclosed in parentheses, is Burmese $\theta \mathrm{we}^{\mathrm{II}}{ }^{\text {eqg: }}$ swaj" ${ }^{\text {II }}$ whet, sharpen vt with Mizo sujul whittle $v t$ (1972a:43) which is an irregular variant form of soji.

[^71]:    ${ }^{193}$ This word also means mountain，south $n$ which Peiros \＆Starostin（1996：\＃1003）compare with Mizo
     exclusive attestation in Mizo make it suspect but more interesting is Peiros \＆Starostin＇s tentative link with $\operatorname{tog}^{\mathrm{I}}$ 東 $\mathrm{t} 2 \mathrm{wg}{ }^{\mathrm{I}}<$＊$^{\mathrm{tan}} \mathrm{y}^{\mathrm{wI}}$ east $n$ ．A semantic connection with this is plausible on the basis of Ohno＇s observation（1967：87）that mountain，in its sense of south $n$ ，may more specifically be referring to the
    
     cardinal directions may be found in Northern Chin where＊ts ${ }^{\mathrm{h}} \mathrm{ek}$ means east $n$ in Mizo but north $n$ in the other languages and $\left.{ }^{*} k^{h} \operatorname{ley}\right]^{1}$ means west $n$ in Mizo but south $n$ elsewhere．

[^72]:    ${ }^{194}$ The Middle Chinese reflex develops as if from－ə－．However，the discussion in Baxter（1992：267－ $69 ; 371-2 ; 580-1$ ）suggests this may be a result of the initial complex．See also the discussion under Alive，Green（\＃10）．

[^73]:     voice $n$ is related to ir $^{\mathrm{I}}$ 心 $\operatorname{sim}^{\mathrm{I}}<$ *' $^{\mathrm{s}} \mathrm{sm}^{\mathrm{I}}$ heart, mind $n$ as noted in Matisoff (2003:532).
    ${ }^{196}$ Not in the inscriptions.

[^74]:    ${ }^{197}$ Peterson (2003:175-8) notes a form ${ }^{\text {h jul follow }}$ in the Southern Chin language Hyow, the name of which also reflects ${ }^{h} j$. The Northern Chin form is ${ }^{*} j u j{ }^{11}$ showing a shift of $-l$ to $-j$ in coda position which will be discussed further in 5.2.2

[^75]:    ${ }^{198}$ See the discussion in footnote 339.
    ${ }^{199}$ Following Ba Shin (1962:72), the second o๗ is assumed to have been omitted.
    ${ }^{200}$ Originally translated by Ba Shin (1962:141).
    ${ }^{201}$ See Pe Maung Tin \& Luce (1960:244-5) for confirmation of this treatment.
    ${ }^{202} \mathrm{Pe}$ Maung Tin \& Luce (1960:242) gloss this as The Holy One and suggest that it could in this instance mean pagoda $n$.
    ${ }^{203}$ Pe Maung Tin (1930:21) and Pe Maung Tin \& Luce (1960:233) note this to be a prefix attached to male Burmans.

[^76]:    ${ }^{204}$ Matisoff (2000b:365) alternatively suggests that the Chinese forms are related to a separate root ${ }^{*}{ }^{W}{ }^{w}$ axj in Benedict (1972a:41) including Mizo $\mathrm{p}^{1}{ }^{1}$ oja ${ }^{1}$ shavings $n$, attested in Weidert (1987:144), Thado
     verb meaning fine, small $v i$ which puts it in a separate semantic field and from which the single Mizo etymon may well be a loan; Northern Chin ${ }^{*}$ waj ${ }^{1}$ chaff $n$ could perhaps be related but it requires assuming $p$-/w- variation for a root in which it is otherwise not required.

[^77]:    ${ }^{205}$ There are possible internal examples in Old Burmese like wa ${ }^{\text {II }}$ o wa ${ }^{\text {III }}$ plump, full $v i$ and pwa ${ }^{\text {III }} 8$ pwa ${ }^{\text {III }}$ swell, bloat vi.
    ${ }_{206}$ This is not restricted to bilabial stops in Vietnamese.

[^78]:    ${ }^{207}$ Sagart（1999b：87－9）provides some interesting，but sparse，evidence for a p－prefix in Old Chinese．
    ${ }^{208}$ Another possible case of lenition is Matisoff＇s（2003：402；428－9）and Peiros \＆Starostin＇s （1996：\＃444）comparison of Mizo war illuminated，white $v i$ with $\mathrm{p}^{\mathrm{h}} \mathrm{w}^{\mathrm{ib}}$ 爗 $\mathrm{ba}^{\mathrm{I}}<{ }^{\mathrm{*}} \mathrm{bal}^{\mathrm{I}}$ white，white－ haired $v i$ although Northern Chin par white $v i$ is also possible．A difficulty is that Old Chinese $-l$ should correspond to Northern Chin $-l$ rather than $-r$ but Matisoff＇s further comparison of fan ${ }^{1 b}$ 燔 buan ${ }^{1}$ ＜＊＇ban ${ }^{1}$ burn，roast suggests an original $-r$ to also be possible．Matisoff＇s additional comparison of Mizo ur smoke，heat，warm vt，as attested in Schuessler（2007：514），appears forced．

[^79]:    ${ }^{209}$ There are no cases of $\omega / \omega^{\circ} j \ddagger$ or $q / \Omega w t$ in Inscriptional/Written Burmese excluding a handful of adverbial or onomatopoeic words attesting the former and the inscriptional form of weI $\sigma$ as qus wij.
    ${ }^{210}$ This is no longer attested before $i$ due to its derivation from $j 2$.
    ${ }^{211}$ Peiros \& Starostin's reconstruction of *wak (1996:\#438) is preferable to Matisoff's (2000a:157-60)
    

[^80]:    ${ }^{212}$ Pulleyblank's argumentation requires a fair amount of special pleading: an OC initial ${ }_{j j}$ - being treated as a vowel and developing a glottal onset; initial ${ }^{*} w$ - having a redundant voicing prefix $a$ before which a glottalic onset could develop; distinctive vowel length in Old Chinese to account for vocalic developments conditioned by medial $-r$ - that would call for initial *? $r$ - as in Baxter's system.
    ${ }^{213}$ This may also be labialised as $?^{\prime \prime}$ - but, as with the case of $k^{\prime \prime \prime}$ - and $k w$-, discussed in 3.1.1, such a distinction is not required in Northern Chin or Old Burmese.
    ${ }^{214}$ See the discussion in 6.1.

[^81]:    ${ }^{215}$ He maintains the possibility of Lolo－Burmese $h$－by reconstructing it for two roots（1988a：220， 2003：58）．
    ${ }^{216}$ They also reconstruct a labialised version in comparisons like Mizo hoam ${ }^{1}$ dare $v t$ ，as attested in Schuessler（2007：335），with Burmese wũ ${ }^{\text {II }} \dot{\wp}$ wam ${ }^{\text {III }}$ dare $v t$（1996：\＃2086）in which their proposed change of ${ }^{*}{ }^{W}$ ．to ${ }^{*} h \sigma$－in Northern Chin parallels Sagart＇s proposed change of Old Chinese ${ }^{*}{ }^{\prime \prime}$－to Middle Chinese $\gamma w$－quite nicely．They also compare $\operatorname{kan}^{11}$ 敢 kam $^{\text {II }}$ dare $v t$ but this is difficult to reconcile phonologically unless a labiovelar initial is assumed to have dissimilated from the bilabial coda to become a plain velar；Matisoff＇s further attempt（2003：300）to associate Mizo yem ${ }^{\mathrm{nb}}$ dare vt confronts additional problems with nasality．
    ${ }^{217}$ Peiros \＆Starostin suggests a possible association with Mizo $\mathrm{k}^{\mathrm{h}} \mathrm{ak}^{\text {Ib }}$ phlegm vi but this is actually a form 2 inflection whose velar derives from a suffixal $-s$ on form $1 \mathrm{k}^{\mathrm{h}} \mathrm{a}^{\mathrm{III}}$ ．The tonally irregular nominal form $\mathbf{k}^{\mathrm{h}} \mathrm{a}^{\mathrm{Iax}}$ phlegm $n$ ，which further compares with tonally irregular Zahau $\mathrm{k}^{\mathrm{h}} \mathrm{ak}^{\mathrm{J}}$ ，is good evidence for the onomatopoeic origin of this root with which Shafer（1952：140）and Schuessler（2003：34）suggest a Mon－Khmer link．

[^82]:    ${ }^{218}$ Based on an original translation by Luce \& Whitbread (1971:195).

[^83]:    ${ }^{219}$ The form without the medial $-r$ - is most likely a modern corruption due to the merger in modern pronunciation. Notably Bradley's correspondence tables (1979:181-2) show other Loloish languages differing in whether they reflect an original $-r$ - or not.
    ${ }^{220}$ The reconstruction follows Matisoff (2006:100); Matisoff (2003:434) reconstructs Tibeto-Burman ${ }^{*} \mathrm{k}^{\mathrm{w}} \mathrm{i}$-s following Benedict's modification of his original *kwi(j) (1972a:140) to *kwis (1979:13).
    ${ }^{221}$ See also Matisoff's comments in Benedict (1979:27).
    ${ }^{222}$ Matisoff (2006:101) also adds a root ${ }^{*} \mathrm{k}^{\mathrm{w}} \mathrm{u}$ fist $n$ due to bilabial initials in some Loloish languages among which Lahu is lacking.

[^84]:    ${ }^{223}$ Although Matisoff (1972b:279) concurs with a basic $i / u / a$ system, he notes (1972b:280-1) that a demonstrable origin in $j a$ and $w a$ for all cases of secondarily derived $e$ and $o$ has not been found such that Benedict's provisional rhymes in $e$ and $o$ assume a more permanent status in the reconstructions in Matisoff (2003).
    ${ }^{224}$ Benedict's occasional reconstruction of pure $-i$ and $-u$ rhymes in contrast with $-i j$ and $-u w$ is chiefly based on Written Burmese. The former is shown in 2.1.4 to derive from an original lateral coda; the latter is discussed inn 5.2.3.1. Matisoff's proposal (1992:170-3) to add another diphthong *-uj to contrast with ${ }^{*}-a j$ after a labial feature stems from a confusion of Burmese forms which should be exclusively assigned to ${ }^{*}-\partial w$ but in which the spelling $\stackrel{\circ}{i}$, a combination of ${ }_{i}$ and $\circ$ represented in modern spoken Burmese as $u$ and $i$, has misled him into trying to associate them with a putative ${ }^{*}-u j$.
    ${ }^{225}$ This correlation specifically refers to $a$ when it is not coloured by surrounding palatal or labial elements. See Baxter (1994a:29-31), who reconstructs $\partial$ and $a$ in his Old Chinese system in the same

[^85]:    rhymes as Pulleyblank when no coloring is assumed, for some correspondence sets supporting this well-established correlation.
    ${ }^{226}$ Benedict's comparison (1972a:16;91) of Mizo ${ }^{\mathrm{h}} \mathrm{ni}^{\mathrm{Ib}}$ gums $n$ with $\mathrm{ni}^{\mathrm{I}}$ \& $\mathrm{ni}^{\mathrm{I}} \mathrm{red} v i$ is phonologically and semantically problematic.
    ${ }^{227}$ Not attested in the inscriptions.
    ${ }^{228}$ Sagart (2006a:218) rejects Matisoff's comparison (2003:404;422) of Mizo and Tedim $\mathrm{t}^{\mathrm{h}} \mathrm{el} \mathrm{l}^{\mathrm{I}}$ arrown
     the tones and coda are discrepant.

[^86]:    ${ }^{229}$ This gloss follows Luce's (1969-70:I.114) original translation of the inscription.

[^87]:     $v t$ ，writing $n$ is loaned into Burmese as $\mathrm{sa}^{\mathrm{I}}$ \＆ $\mathrm{ca}^{1}$ writing $n$ ，sympathise $v t$ shows a more regular correspondence of initials which may possibly be explained by different loan periods but does slightly mitigate his proposal．
     by Sagart（2006a：219）on both phonological and semantic grounds；Benedict＇s further use（1972b：30） of this comparison in support of his theory that an－n suffix caused a tone shift of I to II in Old Chinese is rejected in 6．5．2．See Schuessler（2007：429）regarding the difficulties in reconstructing the initial．

[^88]:    ${ }^{232}$ See Benedict (1972a:166).

[^89]:    ${ }^{233}$ The discovery of correspondence sets is undoubtedly hampered by the difficulty in distinguishing medial - $w$ - in Old Chinese; see the discussion in 3.1.2.
    ${ }_{235}^{234}$ Not attested in the inscriptions.
    ${ }^{235}$ Baxter (1992:182) suggests this may have had an original velar coda which was lost due to the glottal suffix that gave tone II. In the system here this would reconstruct as *'bok ${ }^{\text {II }}$ supporting Baxter's suggestion of a comparison with $p \varepsilon i^{\text {III }}$ 背 $p j^{\text {III }}<{ }^{\text {pok }}{ }^{\text {II }}$ back $n$; see the discussion under Lick (\#13) for another possible example of this.

[^90]:    ${ }^{236}$ Ba Shin (1962:38-9) extends Duroiselle's suggestion (1919:37) concerning village $n$ to propose that the $-h$ in these words represents tone II. The fact that the word for village $n$ is in tone I is already a difficulty here and it seems Ba Shin and Duroiselle are influenced by the transcriptional practice in the Ajāwlat Inscription discussed in 2.4.1.
    ${ }^{237}$ See the discussion in footnote 8.
    ${ }^{238}$ Duroiselle (1919:36) and Stewart \& Dunn (1940-81:265) note this to represent Written Burmese зวฒu์.
    ${ }^{239}$ Based on an original translation by Duroiselle (1919:25).

[^91]:    ${ }^{240}$ See Matisoff(1973b:742).
    ${ }^{241}$ See also Bamboo (\#35).
    ${ }^{242}$ See the discussion in 5.2.7.

[^92]:    ${ }^{243}$ Matisoff（2003：440）compares this to Mizo fe？feed with mouth vt but Shafer（1952：138）and Shorto （2006：71）note a good Mon－Khmer link．
    ${ }_{245}^{244}$ Based on an original translation by Keightley（2000：44）．
    ${ }^{245}$ Itō，in Itō \＆Takashima（1996：I．4－7），discusses the role of this supreme deity．
    ${ }^{246}$ Based on an original translation by Keightley（2000：70）．
    ${ }^{247}$ The backing of the velar coda $-k$ to - ？in Thado and $Z o$ is not significant here．

[^93]:    ${ }^{248}$ See Pulleyblank（1984a：173－4）for the necessity of reconstructing $r$－here．Peiros \＆Starostin （1996：\＃2055）partially support Matisoff＇s association by listing 晸 in the root discussed here but 嵁 in a separate root（1996：\＃2291）．

[^94]:    ${ }^{249}$ However, note also Mizo and Zahau ka ${ }^{1}$ mouth $n$ which is only attested in a verbal sense open (as mouth) in Thado, Tedim and Sizang.
    ${ }^{250} \mathrm{Hla} \mathrm{Pe}$ (1967a:79) notes this to be a Mon loanword; this possibly explains the superfluous final $-h$; see the discussion in under Village (\#45). It occurs in Written Burmese as $\ddagger$ gos.
     ( $1962: 136$ ) glosses it as drop dung for the inscription here; this represents a more literal interpretation in light of the first syllable individually meaning excrement $n$ which Matisoff (2003:201) associates
     may represent the Lolo-Burmese velar animal prefix is likely, but the Karen forms that he attempts to associate, undoubtedly from the same source as Northern Chin *?e" defecate vi, are shown by Shafer (1952:158), Benedict (1994a:5) and Shorto (2006:238-9) to be Mon-Khmer in origin.
    ${ }^{252}$ Based on an original translation by Ba Shin (1962:136).

[^95]:    ${ }^{253}$ There also seems to a Mon－Khmer connection here with Shorto（2006：361－2）linking a root meaning molar tooth，jaw $n$ with han ${ }^{11}$ 領 $\mathrm{y}^{\mathrm{I}}{ }^{\mathrm{I}}<$＂gəm $^{\mathrm{II}}$ jaw $n$ ，a xiesheng derivative of 含；the Burmese form $\tilde{\mathrm{a}}^{\mathrm{I}}$ $\mathfrak{z}^{2} \mathrm{am}^{1}$ molar tooth $n$ compares well with the Shorto＇s glotalically initialled variant（2006：358）．
    ${ }^{254}$ There is a semantically barely distinguishable word jo ${ }^{I}$ ¹ rwimı $^{11}$ assemble，gather vi whose tone II reflex may reflect a peculiarity of the loan process；Hla Pe（1967a：85）and Shorto（2006：213） alternatively propose a link with a Mon－Khmer root with a final $-\eta$ ．

[^96]:    ${ }^{255}$ Benedict proposes similar transitivity distinctions between pũir ${ }^{18} \%$ pwan ${ }^{\text {II }}$ abrade $v i$ and pol goo pwat abrade，rub vt as well as pã1 $0 \&$ ：pan＂ encircle，outflank $v t^{255}$ and pal oos pat encircle $v$ ．The first case looks plausible but Bernot（1978－92：X．135）also notes a transitive sense for püI $\ell \notin: ~ p w a n " ~ w h i c h ~ c a s t s ~$ some doubt on the theory．In the second case，lexical alternates like gəba？ə：：oof $\mathrm{k}^{\text {h }}{ }^{\text {＂I }}$ pat belt $n$ and gabã 2l：oq： $\mathrm{k}^{\mathrm{h}} \mathrm{a}^{\mathrm{I}} \mathrm{pan}^{\mathrm{n}}{ }^{\text {b }}$ belt $n$ ，the latter of which Hla Pe （1967：84）notes to have a Mon correlate in its secondary meaning of baseboard／skirting－board $n$ ，suggest the distinction to be purely phonological with semantic specialisation occurring at a later date
    ${ }^{256}$ This is a Sanskrit term glossed by Luce \＆Whitbread（1971：193）as Unblinking in their original translation of this inscription．

[^97]:    ${ }^{257}$ However Pulleyblank suggests that Type A syllable structure may have allowed the palatalisation of the coda that was prevented in Type B syllables.
    ${ }^{258}$ Possibly related, but not directly, are the words for butterfly $n$ in Matisoff (2003:377) and Peiros \& Starostin (1996:\#1736). The variations in the Northern Chin reflexes are, as noted by Schuessler (2007:281), reflected across Tibeto-Burman.
    ${ }^{259}$ Matisoff (2005:9) reconstructs an allofam *s-la with a supposed Burmese form la $^{\mathrm{m}}$; it is actually a reduced form of $1 \varepsilon$ ? oos lak in close juncture in the compound $\operatorname{lop}^{\text {" }} \varepsilon$ ? owsoos lakp ${ }^{\text {hak }}$ tea-leaf $n$.
    ${ }^{260}$ This is more commonly spelled ${ }^{\text {h lap ops }}{ }^{\text {l lap; see Stewart \& Dunn (1940-81:346). }}$

[^98]:    
     with Zahau，also shows irregular syllable weight with its tone IIb contour that would regularly be in IIa to correlate with Thado，Zo，Tedim and Sizang koy＂；this is is suggestive of an external source．
    ${ }^{262}$ See the discussion in 7．1．5．
    ${ }^{263}$ A phonographic loan with no semantic relationship．

[^99]:    ${ }^{264}$ See also the discussion in 7.5.1.

[^100]:    ${ }^{265}$ Luce's Xôngsai data shows that this variation has also spread to $-l$ codas derived from Sino-Tibetan *-r, as discussed in 5.2.4.1, which leads him to suggest that all Northern Chin $-j$ codas may perhaps be derived from original $-l$. Conversely, the other Northern Chin languages are more conservative here in only attesting forms in $-l$.
    ${ }^{266}$ See also the discussion in footnote 383 regarding evidence in Southern Chin for an original $-l$ coda in Northern Chin ${ }^{\text {juju }}$ follow vt.
    ${ }^{267}$ Shafer (1952:156) suggests a Mon-Khmer link but this is not well supported.
    ${ }^{268}$ Although Matisoff (2004:364) suggests a Tibeto-Burman link between water $n$ and testicle $n$ via the meaning egg $n$, the homophony of the Xôngsai word $\operatorname{til}{ }^{\text {II }}$ water $n$ with til ${ }^{I I}$ testicle $n$ is entirely coincidental due to testicle $n$ being regularly attested with an $-l$ coda elsewhere in Northern Chin such

[^101]:    that it must have derived from an original $-r$ coda. Benedict's association (1972a:37) of Mizo til ${ }^{\mathrm{Ta}}$ testicle $n$ with a Thado form for earthworm $n$ is supported by Matisoff (2004:363-4) but this stems form a faulty transcription of Thado -tel ${ }^{\text {III }}$ earthworm $n$.
    ${ }_{270}^{269}$ Not attested in the inscriptions.
    ${ }^{270}$ Matisoff (2003:451) later correctly cites the aspirated form.
    ${ }^{271}$ Sagart's comparison (2005:163) of Burmese twer' cog twifi flow incessantly $v i$ with the Chinese form below may well be valid but his reconstruction of ${ }^{*} t-l$ - seems solely motivated to accommodate his Old Chinese reconstruction with a lateral initial that is rejected below.
    ${ }^{272}$ Sagart ( $1999 \mathrm{~b}: 158$ ) compares tsuan ${ }^{1} 川$ ts $^{\text {h }}$ wian ${ }^{1}<{ }^{\prime}$ '-won ${ }^{1}$ river, stream $n$ by reconstructing an initial ${ }^{*} t_{-}{ }^{h} l$ - and a tentative liquid coda $-r$; a lateral initial of some kind is supported by xiesheng connections but, in addition to difficulties with codas, this makes an association with the $t$ - initial in water $n$ problematic. Benedict's proposal ( 1972 b :30) that this is an example of Old Chinese tone II shifting to I in the environment of an $-n$ coda is rejected in 6.5.2.

[^102]:    ${ }^{273}$ See Matisoff (1969:177) for discussion.
    ${ }^{274}$ The gloss of so as exhortative may follows Ohno (2005:289) in his original translation of this inscription.
    ${ }^{275}$ Yanson (1994:370-1) associates $\theta a^{\text {II }}$ 上 $s \mathrm{a}^{\text {III }}$ with a Pali pronoun which he further links to the established pronoun marker $\theta u^{\text {II }}$ pr su ${ }^{\text {II }}$. Yanson (2002a:41-8, 2005:224-8) extends this to the attributive marker $\Theta o^{\text {II }} 6000$ saw ${ }^{\text {II }}$ which is the status assigned to $\Theta a^{\text {III }} 20 \mathrm{sa}^{\text {III }}$ in the above inscription. With the emphatic marker teI $6 \infty$ tij serving as a surrogate copula, as noted in footnote 174 , this represents a grammatically more faithful, albeit functionally unnecessary, rendition.
     radiate, overflow vi via a suffixed form like ${ }^{* h}$ ljam-ma $>{ }^{* h} \mathrm{l}$ ja-ma. Benedict provides no source for the suffix leading Matisoff (1994b:54, 1995:71, 2003:299-300) to simply assume an allofamic variant *sljam. In fact such ruminations are unnecessary as Shorto (2006:383-4), supported in Shafer (1952:144), shows the word to be Mon-Khmer in origin. Benedict's proposal (1972a:172) for a polyphonic s ${ }^{16}$ 舌

[^103]:    
     phonetic in 舔 is clearly $\mathrm{t}^{\mathrm{h}} \mathrm{ien}^{\mathrm{I}}$ 忝 $\mathrm{t}^{\text {h }} \mathrm{Em}^{\text {I }}$ ，shame $v$ ；the others are somewhat harder to justify but Takashima（2003：II．428－9）notes another word in the Shuowen $\mathrm{t}^{\text {hi }}$ 的 ${ }^{\text {II }}$ 丙 $\mathrm{t}^{\text {he }} \mathrm{m}^{\text {III }}$ with which，in spite of Qiu＇s observation（2000：186）that it actually represents a phonologically shifted form of tien＂管 ${ }^{\text {W }}$ d $\mathrm{dm}^{\text {＂}}$ mat $n$ rather than the Shuowen gloss of tongue $n$ ，there may have been graphic confusion．
    ${ }^{277}$ This allows the rejection of a couple of tonologically discrepant proposed correspondences：Peiros \＆Starostin（1996：\＃1151）and Sagart（2006a：215），via his citation of Matisoff（2003：190），compare
    
     earth，ground $n$ to Mizo $1 \mathrm{\varepsilon j} \mathrm{j}^{\mathrm{I}}$ ground $n$ ．In the former case a comparison with Old Burmese seri＂${ }^{\mathrm{If}} \mathrm{cij} \mathrm{j}^{\mathrm{II}}$ seed $n$ remains possible but the lack of initial aspiration and the derived tone III are less than ideal；in the latter case Sagart＇s tacit rejection（2006a：218）of a previous proposal（1985：215－6）to instead follow
     rather than the Shijing rhyme ${ }^{*}$－all ${ }^{1 /}$ that gave the Middle Chinese，rhyme is treated as original． ${ }^{278}$ The Middle Chinese reflex reflects a lowering of $\partial$ to $a$ ．

[^104]:    ${ }^{279}$ In Modern Burmese this can also mean palm $n$ making it indistinguishable from le?wa ${ }^{\text {II }}$ comol: lakwa ${ }^{\text {II }}$ palm $n$.
    ${ }^{280}$ The gloss of ${ }_{\AA}{ }^{\delta}$ as worship follows Luce \& Whitbread (1971:192) in their original translation of this inscription.

[^105]:    ${ }^{281}$ Matisoff (1970:36-7) treats these two Burmese forms for flute $n$ as independent but they are undoubtedly the same.
    ${ }^{282}$ Benedict makes similar proposals for a length distinction involving $u$ before $-k$ (1972a75-6) and $i$ before $-t$ (1977:2) on the basis of Burmese reflexes, and for $a$ before $-p$ on the basis of Garo reflexes (1972a:72). The latter is beyond the scope of this work but the Burmese case with $u$ is rejected in 2.1.1 and the extremely limited evidence regarding $i$ is directly contradicted by the evidence in Extinguish

[^106]:    (\#50). The assumption in Benedict (1972a:70, 1991:27) that a poorly attested length distinction may be reconstructed for Tibeto-Burman is unlikely.
    ${ }^{283}$ See the discussion of Northern Chin ${ }^{*} \mathrm{Kow}^{\text {II }}$ call $v t$ in 5.2.3.3.
    ${ }^{284}$ Matisoff (2003:227) notes that his comparison of Mizo tu- ${ }^{-1 I}$, as the first syllable of a compound noun meaning hammer $n$, with Burmese tu' ${ }^{\prime}$ twit hammer $n$ is an exception. Evidence from elsewhere in Northern Chin shows the root meaning of the Mizo form to rather be small-hoe $n$ with a verbal sense of chop vt. In Mizo only the verbal sense is retained in the form 2 inflection tok which leads Matisoff (2003:357) to make an otherwise phonologically sound comparison with tav? $\quad 0050 \times \infty$ tiwk fillip wt; Shorto (2006:143) suggests a Mon-Khmer link with Matisoff's root with the suggestion that it may be onomatopoeic in any case.

[^107]:    ${ }^{285}$ Peiros \& Starostin reconstruct ${ }^{*}$ c- due to a confusion with the Northern Chin forms listed under Rot (\#28).
     and su" $q$ : $\mathrm{cwi}^{\prime \prime}$ awl $n$, pierce $v t$ with the tonally discrepant Thado sow' panji $n$ is therefore unlikely.

[^108]:    ${ }^{287}$ This is an irregular spelling of $2_{8}^{2}$ ，attested in Written Burmese as 288 ：in which the first syllable， discussed under Fruit（\＃80），has been reduced in close juncture．
    ${ }^{288}$ Originally translated by Luce（1969－70：II．35）．

[^109]:    ${ }^{289}$ A similar case with this rhyme of a derived tone III in Chinese corresponding to tone I in Northern Chin may perhaps be found in Matisoff＇s（2003：227）and Peiros \＆Starostin＇s comparison of Northern
    

[^110]:    ${ }^{290}$ See also the brief discussion in Benedict（1972a：14－6）．
    ${ }^{291}$ See the discussion in 3．2．1．
    ${ }^{292}$ In addition to illuminate，white vi，discussed in footnote 208，the following may also be noted：the variation between Mizo ${ }^{\mathrm{h}} \mathrm{muj}{ }^{\mathrm{ill}}$ muzzle $n$ and ${ }^{\mathrm{h}} \mathrm{mur}{ }^{\mathrm{II}}$ lips $n$ ，as tentatively associated by Peiros \＆ Starostin（1996：\＃163），appears to be due to external influences as discussed in 6．5．4；Matisoff＇s （2003：416；424）and Peiros \＆Starostin＇s（1996：\＃50）comparison of Mizo and Tedim bul ${ }^{\mathrm{D}\left({ }^{(a)}\right)}$ base $n$ with Chinese pən ${ }^{\text {II }}$ 本 $\mathrm{p}_{\mathrm{n}}{ }^{\mathrm{II}}<{ }^{*}$ pen ${ }^{\mathrm{II}}$ base，foundation $n$ has problems with initial voicing and Schuessler （2007：160）questions the validity of an original lateral coda while noting a possible association with fon $^{1}$ 分 pun ${ }^{1}<{ }^{*}{ }^{\prime} \mathrm{pan}^{\text {² }}$ divide vt；Matisoff＇s（2003：405）and Peiros \＆Starostin＇s（1996：\＃2139） comparison of Mizo and Tedim kel ${ }^{\mathbb{I}}$ kidney $n$ with Burmese $\mathrm{k}^{\mathrm{h}} \mathrm{a}^{\mathrm{II}}$ 。l： $\mathrm{k}^{\mathrm{h}} \mathrm{a}^{\mathrm{II}}$ waist，loins $n$ is semantically slightly tenuous．
    ${ }^{293}$ This is also the case with the original $-k$ series as shown in 1．4．2．

[^111]:    ${ }^{294}$ See the discussion in 6.4 regarding the association of tones I and II.
    ${ }^{295}$ Matisoff (2003:396) proposes another possible case with Old Burmese $-n$ in his comparison of Mizo tor $^{\mathrm{rb}}$ urge, give pulsating pain vt and to $\tilde{v}^{\mathrm{I}}$ Q $^{\boldsymbol{\beta}} \mathrm{twin}^{1}$ tremble vi. Only Zahau has an associated form in tor ${ }^{\mathrm{I}}$ pulsate vi and, with the irregular Mizo form not showing tor? an external source should not be ruled out.
    ${ }^{296}$ See the discussion in 7.3.
    ${ }^{297}$ Benedict also compares qu ${ }^{11}$ 洳 nina ${ }^{1 / \Pi I I}<*^{\prime}$ na $^{3 /[I I}$ marsh $n$.

[^112]:     Northern Chin *kul ${ }^{1}$ twenty $v i$ via the nominalised form kow̃ $^{1}{ }^{1} \AA{ }^{\AA}$ kwin $^{1}$ all $n$, but the semantic fields are clearly distinct with the Burmese sense of all $n$ being derived from a sense of complete consumption
     $v i$ but the semantics are very tenuous; Matisoff (2003:516) and Peiros \& Starostin (1996:\#660) compare jã̃ ${ }^{1}$ § ran $^{1}$ enmity $n$ with Mizo ral' ${ }^{1}$ and Tedim gal' ${ }^{\text {enemy }} n$ but the Burmese meaning appears to be a semantic extension of its verbal meaning side by side $v i$ with Northern Chin *ral ${ }^{1 / 1}$ opposite-side $n$ showing a similar case of areal semantics rather than root cognacy; Matisoff's addition (2003:418) of a Lai word correlating with Northern Chin *kul ${ }^{\text {II }}$ bend $v i$ to a comparison of a Lai word correlating
     fortuitous coalescence or external influences; Matisoff (2003:71) compares Tedim kal ${ }^{1}$ interval $n$ with
     $\mathrm{kar}^{1}$ between $n$ ignores its regular attestation in Tedim as $\mathrm{kak}^{1}$ widen, stride vi.
    ${ }^{299}$ Matisoff's comparison (1995:85, 2003:203-4) of Mizo pe? pierce vi/t with pe ${ }^{\text {II }}$ © ${ }^{\text {pajiI }}$ break off vi/ $\mathrm{p}^{\mathrm{h}} \mathrm{e}^{\mathrm{II}} \mathrm{e}^{\mathrm{h}} \mathrm{h}^{\mathrm{h}} \mathrm{j}^{\mathrm{II}}$ break off $v t$ and $\mathrm{p}^{\mathrm{h}} u 0^{\text {II }}$ 破 $\mathrm{p}^{\mathrm{h}} \mathrm{a}^{\text {II }}<*^{\mathrm{h}} \mathrm{p}^{\mathrm{h}} \mathrm{al}^{\text {II }}$ break, smash is phonologically and semantically unlikely. Two of Matisoff's comparative sets, bend, coil vi/n and scatter vi/t, suggesting an association between Northern Chin -I/-il and Burmese -wij (2003:410-1) are rejected in footnote 396. The remaining two are also unlikely: *hril choose, inform $v t$ shows a similar semantic association as
     redemption $n$; a semantic link between Zahau ril" ${ }^{\text {TII }}$ roll along $v$, including its derivative ${ }^{\text {"ril" }}{ }^{\text {II }}$ roll along
     Matisoff's further comparison of Northern Chin ${ }^{\mathrm{j} \text { jal }}{ }^{\mathrm{I}} \sim{ }^{*} \mathrm{j}_{\mathrm{ja}}{ }^{\text {III }}$ roll $u p v t$ is phonologically implausible.

[^113]:    ${ }^{300}$ Matisoff＇s（1985：35）and Peiros \＆Starostin＇s（1996：\＃116）comparison of Zahau and Mizo moj ${ }^{1}$ beautiful vi respectively is treated as a Chinese loanword in 6．5．4．
    ${ }^{301}$ This tacitly rejects his previous suggestion（1969：190）that it may be the same prefix as ones possibly attested in the word for horse $n$ discussed in 6．5．4．

[^114]:    ${ }^{302}$ Nevertheless Nishi (1977:51) also notes that the lateral in the rare spelling of th" $\varepsilon$ ? qाo $\mathrm{k}^{\text {h }}$ jak cook $v t$ as a ${ }^{\text {an }} \mathrm{k}^{\text {hlak }}$ is supported by Benedict's comparison (1972a:39) of Mizo t'ek boil vt; to this may be
    
    ${ }^{303}$ The superfluous a vowel before qूes is a peculiarity of the earliest inscriptions which Ba Shin (1962:29) and Yanson (1994:366-7) attribute to Mon scriptural influence.
    ${ }^{304}$ See Ba Shin's original translation (1962:130) for contextual support for the progressive sense here.
    ${ }^{305}$ Matisoff (1985a:40) and Pulleyblank (1995:175-9) suggest there may be an association with mien ${ }^{111}$面 mjian ${ }^{\text {IIt }}$ < $*^{\prime}$ mjan ${ }^{\text {III }}$ face $n / v t$ but this is phonologically, and in the case of Pulleyblank's proposal palaeographically, unlikely. Following Benedict (1972a:173), Matisoff associates Northern Chin *h $^{\text {mel }}{ }^{1}$ visage $n$, but the failure of the Northern Chin form to regularly reflect -Iar suggests an external influence, attributed by Shafer ( $1952: 154$ ) to Mon-Khmer, to be likely.
    ${ }^{306}$ See Pulleyblank (1996b:45;55) for a tentative proposal linking the Mon form with an alternative Chinese etymon.

[^115]:    ${ }^{307}$ Pulleyblank (1995:175-9) modifies this to *'mjok ${ }^{\mathrm{w}}$ and then further modifies it (2004:158-9) to $*^{\prime}$ mjek ${ }^{4}$; neither case is particularly convincing.
    ${ }^{308}$ Pulleyblank is also motivated by his reconstruction of the labiopalatal velars $-k^{n}$ and $-\eta^{\eta}$ which, as discussed in footnote 95, are not adopted here.
    
     irregular comparison with $-t$ in Thado, Zo, Tedim and Sizang is ignored. However, internal phonological issues in Northern Chin aside, the former Burmese etymon was shown to be originally १ $_{\boldsymbol{\phi}}$ ${ }^{{ }^{\mathrm{h}}}{ }{ }^{1}{ }^{1}$ put side-by-side $v t$ in 2.3.1.5 and the latter actually means quality, attribute $n$ as a single morpheme and only means equal vi when compounded with the latter morpheme meaning same $v i$.
     posit an unidentified $-n$ suffix.
    ${ }^{310}$ Pulleyblank's Old Chinese reconstructions are retained as $-c$ and $-n$ for the sake of continuity.

[^116]:     close juncture in the compound noun with the preceding voiced coda.
    ${ }^{312}$ This gloss follows Luce (1977a:55).

[^117]:    ${ }^{313}$ Matisoff (2003:323) also attempts to compare Mizo hrat ${ }^{\text {nb }}$ scratch at, itch $v t$ with Burmese j ? wos jak rake in with hands vt under a root *hjak that follows Benedict's proposal (1972a:46;55) that -Iak > - Iat on the basis of a purported association between Mizo $\mathrm{p}^{\mathrm{h}} \mathrm{tat}^{\text {th }}$ sweep $v t$ and Tibeto-Burman etyma with $-k$ meaning broom $n$. Without Old Burmese or Old Chinese comparanda a precise reconstruction of the latter is difficult to make but it should be noted that the Mizo word for broom $n$ ends in -1 , not $-t$, as the form 2 derivative of sweep vt. Regarding the former, Zahau ${ }^{\text {n }}$ rat ${ }^{\text {nb }}$ scrape, scratch, comb vt shows an aspirated rhotic initial, and Benedict, in French (1983:521), suggests on the basis of Northern Naga evidence that a reconstruction with -t may be preferable in any case.
    ${ }^{314}$ This is restricted in distribution in Northern Chin; only the form 2 is retained in Tedim while in Thado the form 1 curiously seems to imply an original velar coda although this may have been influenced by Tedim.
    ${ }^{315}$ Wheatley (1982:31) suggests that Өer? 38 sjip compress, cram, put to sleep $v t$ is a causative derivative via a semantic connection of tuck in vt. Matisoff (2003:114) notes that this causes problems for deriving the Lolo-Burmese glottalised initials from an original $s$ - prefix and treats it as a case of
     $\operatorname{sway}^{\text {I }}$ insert vt while also noting a possible association with win ${ }^{11}$ of: way ${ }^{\text {I }}$ enclosure $n ; \mathrm{Hla} \mathrm{Pe}$ (1967a:85) shows the latter to be a Mon loanword and the tonal discrepancy in the former two is problematic.
    ${ }_{316}$ There is a possible association with the form 2 of Zo , Tedim and Sizang im ${ }^{\text {III }} \sim$ Ip retain (secret) $v t$ whose coda development would then parallel that of Snot (\#97) as discussed in 7.5.1.

[^118]:    ${ }^{317}$ A similar merger of $-m$ with $-n$ occurred between Middle Chinese and Mandarin.

[^119]:    ${ }^{318}$ Starostin's (1995:228) and Peiros \& Starostin's (1996:\#2248) proposal to associate Mizo kut hand n via semantic specialisation from a root meaning bone of hand $n$ is unlikely. Notably Starostin (1995:229) accepts Sagart's proposal as a viable alternative.
    ${ }^{319}$ Tedim uses pek ${ }^{\mathrm{II}}$ flat $v i$ in a similar manner while Thado and Zo use $\mathrm{p}^{\mathrm{h}} \mathrm{m}^{\mathrm{T}}$ palm, sole $n$ which in Sizang means slice $n$.
    ${ }_{320}$ The inscriptional form is discussed under Foot, Leg (\#60).

[^120]:    ${ }^{321}$ Peiros (1998:216) suggests that two suffixes, -7 and -H , may be reconstructed to account for the Sino-Tibetan tonal system but Peiros \& Starostin (1996) only reconstruct -H which appears to have been indiscriminately applied to any series where there is evidence for tone II or III in the data.
    ${ }^{322}$ Albeit seeming to be only superficially related, vocalic distinctions need to be made before sonorant codas in any case; see the discussion in 3.4.

[^121]:    ${ }^{323}$ The improbability of Benedict＇s alternative proposal（1972b：27）to treat Old Chinese tone III as a sandhi phenomenon，distinct from Old Burmese tone III for which he provides no source，is noted in Weidert（1987：178）．
     coda to suggest that it represents the hardening of an original $-s$ coda maintained in some Tibeto－
     $\mathrm{k}^{\mathrm{h}} \mathrm{wif}^{\text {jlh }}$ nac which he reconstructs（1972a：56）with a final－t．Although Benedict（1972a：169；185）does not include $2 \chi^{\text {II }}$ 二 $\mathrm{ni}^{\text {III }}<*^{\prime}$ nəc－s two $v i$ in his analyses due to Karlgren（1957：150）reconstructing an $-r$ coda，Matisoff（1988a：767）makes an assumption of $-s>-t$ here also to account for his reconstruction of ${ }^{\mathrm{h}} \mathrm{nIR}$ ？$\alpha_{\infty}{ }^{\text {n }}$ nac $t w o v i$ with final $-t$ ．
    ${ }^{325}$ Benedict follows Karlgren（1957：321）in reconstructing an Old Chinese－$t$ coda．
    ${ }^{326}$ Interestingly there is evidence of another kind for Old Chinese $-s$ merging with $-t$ internally． Pulleyblank（1973b：372，1998b：205）suggests that $-s$ sometimes dialectally shifted to $-t$ in words like $\mathrm{si}^{\text {II }}$ 四 $\mathrm{si}^{\mathrm{II}}$ four $v i$ with its Jiyun reading of sit and pil ${ }^{\text {鼻 }}$ bjit nose $n$ with its Guangyun reading of bjiri ． The phonetic of the latter， $\mathrm{pi}^{\text {III }}$ 界 $\mathrm{pji}^{\text {II }}<*^{\prime} \mathrm{p}^{\prime} \mathrm{j}^{\text {II }}$ ，is reconstructed by Baxter（1992：603）with an original －t coda which Matisoff（2000b：365）uses to support Benedict＇s rather superficial ruminations （1972a：101）of an association between Tibeto－Burman $t$ and Northern Chin $-k$ by connecting Northern Chin ${ }^{\text {pra }}{ }^{\text {II }} \sim{ }^{*}{ }^{\text {prak }}$ give $v t$ ；the rhymes do not correspond and the $-k$ in the form 2 inflection is derived from suffixal $-s$ as ${ }^{*}{ }^{\text {pra }}{ }^{\text {n }}$－s．

[^122]:    ${ }^{327}$ Löffler (2002b:139) also notes an association of tone II with obstruent codas in Tedim.
    ${ }^{328}$ The derived nature of tone III excludes it from the discussion.
    ${ }^{329}$ Luce's tentative proposal that the open rhymes in IIb may have been conditioned by the loss of an original final voiced obstruent is based on the now disfavoured proposal for voiced obstruents in Old Chinese discussed in 3.2.3. It is likely Luce was influenced in this analysis by the association of tone IIb with obstruent codas.

[^123]:    ${ }^{330} \mathrm{An}$ alternative suggestion by French (1983:559) that it may rather be associated with Burmese $\theta$ er ${ }^{\text {n }}$ ${ }^{630}$ : sjji ${ }^{11}$ small vi concurs better in rhyme and tone but the sibilant initial is still a problem.
    ${ }^{331}$ This is a Lolo-Burmese reconstruction hence the reconstructed tone contour.
     reconstructs as Lolo-Burmese *kji:n'; Matisoff (2003:277) and Peiros \& Starostin (1996:\#2047) compare Mizo $\mathrm{k}^{\text {h}}{ }^{\text {III }}$ weigh vt which is not attested in the other five Northern Chin languages discussed here and is probably a Burmese loan.

[^124]:    ${ }^{333}$ Sagart (1999b:134) notes that in Old Chinese there are also apparent cases in tone I such that no defintive statement can be made.
    ${ }^{334}$ Tedim and Sizang have an irregular $l$ - initial here suggesting a loanword origin.
     (1992:170, 2003:293) includes it under a root containing Thado ken ${ }^{\text {II }}$ leg $n$ and Tedim xe ${ }^{\text {III }}$ leg, foot $n$; Tedim has both key ${ }^{\text {II }}$ leg $n$ and $\mathrm{xe}^{\text {III }}$ foot $n$ and Luce (1962a:57) is wary of associating the two. A better association for $\mathrm{y}^{\mathrm{h}^{1} \mathrm{i}^{1}\left(\mathrm{~s}^{\mathrm{l}} \mathrm{i}^{\mathrm{I}}\right)} \mathbb{0}^{\mathcal{E}}\left(\mathrm{o}^{8}\right) \mathrm{k}^{\mathrm{h}} \mathrm{ray}^{\mathrm{l}}\left(\mathrm{c}^{\mathrm{h}} \mathrm{j}^{\mathrm{j}}\right)$ marrow $n$ may be found in Benedict's root for bone $n$ (1976a:163;176) which then allows the Burmese form, in which the latter syllable means fat $n$, to be analyzed literally as bone-fat $n$ with a velar animal prefix; Zahau ray ${ }^{\top}$ bones $n$ may also be added.

[^125]:    ${ }^{336}$ The final $-h$ corresponds to tone II due to this forming part of the Ajāwlat inscription discussed in 2．4．1．
    ${ }^{337}$ See the original translations in Pe Maung Tin \＆Luce（1960：255）and Luce（1969－70：I．111）for the possible context behind this inscription．
    ${ }^{338}$ Matisoff and Peiros \＆Starostin compare ${ }^{\text {h}} \mathrm{min}^{1}{ }^{1}{ }^{\mathrm{c}}{ }^{\text {h }}{ }^{\text {mand }}{ }^{1}$ composure $n$ due to its appearance in some compounds referring to somnambulism；the glosses in Bernot（1988：XI．196）show it to be unrelated．
     lim，equivalent to æ̊\＆，before me？טeธ mak in the inscription noted under Night（\＃31）where it has assimilated the nasal feature of the following segment．In the case here the newly assimilated $-m$ coda is simply omitted from the first syllable．Notably in Modern Burmese both el？ lm ？and erme？are acceptable pronunciations．
    ${ }^{340}$ Originally translated by Ba Shin（1962：129）．

[^126]:    ${ }^{341}$ The interpretation of 茓 as 腎，being the original graph for truo 晰 traiwk chop，cleave $v t$ ，follows Takashima（ $1979: 54,2004: 8$ ）；the sense is that of one day becoming another．
    ${ }^{342}$ Sagart assumes dialect differences．
    ${ }^{343}$ See also you $n$ in 6．5．4．
    ${ }^{344}$ Schuessier（2007：441－2）notes a plausible Mon－Khmer connection with the latter Chinese form．

[^127]:    ${ }^{345}$ The similarity of the modern Standard Burmese pronunciation of $\mathrm{t}^{\text {han }} \mathrm{T}^{\mathrm{I}} \infty \mathrm{c}: \mathrm{t}^{\mathrm{t}}$ ay ${ }^{\mathrm{II}}$ fuel，firewood with the Northern Chin form is entirely coincidental．

[^128]:    ${ }^{346}$ Based on Than Tun＇s original translation（1958：46）of this inscription where he glosses ago 0 \＆as flowers of rice food．
    ${ }^{347}$ See the discussion under Bitter（\＃1）．
    ${ }^{348}$ A possible example is ${ }^{*}$ wral＇coil vi and ${ }^{*}$ wral ${ }^{1}$ times $n$ but cases like ${ }^{*}$ paji carry on oneself vi and ＊paj＇sheath $n$ show an inverse relationship．

[^129]:    ${ }^{349}$ See also the discussion in 6.5.1.
    ${ }^{350}$ Ba Shin's (1962:96) gloss of star of dawn $n$ in his original translation of this inscription is supported by the modern constellation nomenclature oْcloぁ¢\%® Southern Cross $n$.

[^130]:    ${ }_{352}^{351}$ In certain cases it appears to have been replaced by the native word $\mathfrak{n a} a^{\mathrm{I}}$ c： $\mathfrak{y} \mathrm{a}^{\mathrm{I}}$ ．
    ${ }^{352}$ Original translations of these may be found in Takshima（2003：I．248）．

[^131]:    ${ }^{353}$ The treatment of wei ${ }^{\text {ib }}$ 隹 $\mathrm{jwi}^{\mathrm{i}}$ as an explanatory copula follows Takashima＇s proposals in Takashima and Itō（1996：I．460－3）．
    ${ }^{354}$ The functional translation of $\stackrel{A}{\mathrm{~A}}$ as mishaps follows Takashima（2003：II．120－122；286－287）．
    ${ }^{355}$ See Takashima（2003：II．253）for a discussion of this interpretation．
    ${ }^{356}$ See Serruys（1982：462）for a discussion of this graph．

[^132]:    ${ }^{357}$ Also of note are here are the following: Weidert (1987:440-1) suggests that tone I in Northern Chin * ${ }^{1}$ li ${ }^{1}$ flea $n$ appears to be the basic Tibeto-Burman reflex but Matisoff (2003:192-3) and Peiros \& Starostin (1996:\#1932) compare ${ }^{\text {h ler }}{ }^{\text {" }}$ sq: ${ }^{\text {" } 1 \mathrm{jj}}{ }^{1 \mathrm{l}}$ tiny vi, flea $n$ which is not attested in the inseriptions and has a nominalised form meaning insignificant thing, pest $n$ suggesting that flea $n$ is either a semantic extension that happens to coincide phonologically with other words in Tibeto-Burman or alternatively has influenced the tonal development of the word for flea $n$; Mizo ${ }^{\text {haga }}{ }^{\text {Ta }}$ viscous $v i$ is compared by Matisoff (2003:304) to an $^{\text {bl }}$ 瀼 nian ${ }^{\mathrm{I}}<$ *'nay $^{\mathrm{I}}$ heavy with dew/grain vi but in the latter sense there is a variant reading in tone II which corresponds tonally; Matisoff (2003:268) and Peiros \& Starostin (1996:\#2149) compare $\mathrm{kr}^{1}$ ๓ $\mathrm{kay}^{1}$ roast vt to Mizo $\mathrm{key}^{\mathrm{I}}$ fry vt , kay ${ }^{\text {II }}$ burn vi and key ${ }^{\mathrm{Ib}}$ evaporate vi of which the former is the most appropriate; the tonal discrepancy in Matisoff's (2003:195) and Peiros \& Starostin's (1996:\#2786) comparison of Mizo "moj" ${ }^{\text {I }}$ spindle $n$ with ${ }^{\text {" }}$ mwer ${ }^{\mathrm{II}}{ }_{\text {eg. }}{ }^{\text {" }}$ mwij" " wirl $v t$ may well stem from the different parts of speech with tone III being a derived tone in any case.

[^133]:    ${ }^{358}$ Based on an original translation by Than Tun（1959：181）．
    ${ }^{359}$ See the discussion in footnote 370 ．
    ${ }^{360}$ See Nishi（1974：26－7）for a discussion of the evolution of this word．
    ${ }^{361}$ Pulleyblank actually supports Benedict＇s comparison by reconstructing a putative＊＇mjon ${ }^{1}$ in which the medial $-j$－palatalised the coda but this makes his attempted association with may ${ }^{1 \mathrm{~b}} / \mathrm{m}^{1} \eta^{1 \mathrm{~b}}$ 呡 $\mathrm{m} \partial \mathrm{ijy}{ }^{1}$ $<$＊mran $^{1}$ somewhat more elliptical．
    ${ }^{362}$ The superficial phonological correspondence with the modern Mandarin form of ny ${ }^{11}$ 女 nria ${ }^{11}<*^{\prime} r$ r－ na ${ }^{\mathrm{I}}$ woman，female，girl $n$ leads Matisoff（1991a：342）to suggest a possible association；the Old Chinese form shows this not to have been the case．
    ${ }^{363}$ The discussion in 5.2 .7 suggests that male $n$ and female $n$ should be reconstructed with an original $-s$ coda as＊pas and＊nus respectively，but the special nature of kinship terminology suggests the tonal alternation to be an unrelated secondary development．The irregular form 2 pet of pa ${ }^{\text {II }}$ ，when it occurs as the second part of a compound meaning elder $v i$ ，is supportive of this interpretation．

[^134]:     variant form; see the discussion of similar forms under Mother.
    ${ }^{365}$ Based on an original translation in Stewart \& Dunn (1940-81:273).
    ${ }^{366}$ Following his proposal for a semantic link between big vi and mother/female (1991a:319-20),
     animals $n$ may be related here. This proposal is not repeated in Matisoff (2003:448); notably the Mizo form is treated as derived from " $\mathrm{pi}^{i}$ in the other five languages without the labialisation.
    ${ }^{367}$ Luce (1981:13) also suggests a meaning of ancestor $n$.
    ${ }^{368}$ Based on an original translation in Pe Maung Tin \& Luce (1963:64).

[^135]:     inscription．The former syllable by itself has this meaning while the latter syllable is glossed as grandfather $n$ by Pe Maung Tin \＆Luce（1963：64）and then grandmother，ancestor $n$ by Luce （1981：13）；here it is treated as ancestor $n$ although it could equally well be treated as grandmother $n$ to give a compound sense of grandparents $n$ as appears to be the case in the inscription listed under grandmother $n$ ．
    ${ }^{370}$ The Burmese female suffix ma $^{\text {II }}$ ө ma $^{\text {II }}$ corresponds vocalically with Old Chinese mu ${ }^{\text {I }}$ 母 məw ${ }^{\text {II }}<$
    
     the similar form under Father．Matisoff＇s comparison（2003：223；227）of mu ${ }^{\text {I }}$ 母 mow ${ }^{\text {I }}<$＊mə $^{\text {II }}$ mother $n$ with Northern Chin＊mow＇daughter－in－law $n$ is based on a superficial correspondence of modern pronunciations．

[^136]:    ${ }^{371}$ Miller (1988:525) does not address the numbers one and ten due to their greater instability, and no cognate sets have been established for the languages here. Matisoff (1997a:17-8) attempts to relate
     Burmese form is shown by its variant Written Burmese form sem with a $-k$ coda as noted by Stewart \& Dunn (1940-81:80) and Hla Pe (1960:74;89), and a phonological association between the Chinese and Northern Chin forms is incredibly unlikely.

[^137]:    ${ }^{372}$ See also Shorto（2006：415）．
    
    from a Mon source ending in $-p$ ．
    
    ${ }^{375}$ The irregular Mizo IIa tonal contour confirms an external origin．
    
    170

[^138]:    ${ }^{377}$ Matisoff（2000a：179）notes the Lolo－Burmese correspondences to be irregular．
    
     loanword and further suggests（2003：186）it may be imitative in origin due to similar words in Austronesian and Tai，noted by Shorto（2006：128），Peiros \＆Starostin （1984：125）and Schuessler（2003：16），to which may be added Zahau kt－rik tickle vt．
    ${ }^{379}$ Sagart（1995a：251）treats the Burmese form as a Chinese loanword；Sagart（2007：4）suggests a uvular initial for both Chinese forms．
    ${ }^{380}$ Matisoff（1988a：1339，2003：393－4）and Peiros \＆Starostin（1996：\＃1461）compare wer $60 / \rho w^{2}$ waji buy vt but the phonological correspondence is poor．
    ${ }^{381}$ Schuessler（2007：96），following Baxter（1992：202），proposes that the alternation of Middle Chinese $j$－with the initial $t s$－in the xiesheng derivative tciw ${ }^{\text {¹ }}$ 酒 tsuw $^{17}<$ ${ }^{*}$＇cow ${ }^{\text {I }}$ wine $n$ suggests an original Old Chinese $j$－rather than $l$－due to the palatal initials being phonetically close enough to overlap in xiesheng series．Nevertheless， Bodman＇s evidence（1980：93）for a liquid initial elsewhere in Tibeto－Burman supports Sagart＇s reconstruction（1995a：251）of＊l－which leaves the origin of ts－unresolved．

[^139]:    
    ${ }^{389}$ There is possibly an association with $\mathrm{k}^{\mathrm{h}} \tilde{o}^{\pi} \mathfrak{q}: \mathrm{K}^{h}$ wim ${ }^{\mathbb{E}}$ convex $v$; Matisoff (2003:276) includes this under a separate root with Mizo kom ${ }^{1}$ shrug, cup hand vi but the other Northern Chin languages correspond irregularly in aspiration and syllable weight further suggesting an external source.
     to be derived from xam $^{1}$ lie down $v i$; the reconstruction of an Old Chinese velar initial follows Bodman (1980:183-4) and Baxter (1992:551).
    ${ }^{391}$ This is attested in the earliest inscriptions as 童 which leads Norman \& Mei (1976:286-8) to suggest that it must have been a very early loanword; Benedict (1994a:5-7) notes that the regularity of the Tibeto-Burman forms also suggests a very early loan. The correct reconstruction of the initial is unclear: Sagart (1999b:41) suggests *hr- on the basis of xiesheng evidence while the Mon-Khmer forms in Shorto (2006:114) show an original $* k l$-; Pulleyblank ( $1983: 427-8$ ) notes a $5^{\text {th }}$ century Chinese dialect word
     ${ }^{392}$ This may well be associated with the root for bosom, chest $n$ below.
    ${ }^{393}$ Gong (1995:74) compares tir $\omega \mathcal{D}_{\mathrm{s}}$ tay ${ }^{\mathrm{I}}$ taut $v i$, tauten $v t$ to the Chinese form.
    ${ }^{394}$ This is noted in Weidert (1975:24) and is restricted to Mizo where it occurs in tone IIb .

[^140]:    ${ }^{395}$ Matisoff (1980:30-1), rejecting a previous argument (1972b:279) that it is related to Northern Chin ${ }^{*}$ Tar' star $n$ via metathesis of the $a$ and $-r$ with the unstated mplication that the $-j$ is a diminutive suffix, relates $f \mathrm{fe}^{1} \mathrm{~m}_{0} \dot{\mathrm{~s}} \mathrm{kraj}$ star $n$ via a metaphorical association of the scattered appearance of stars in the night sky.
     This suggests any association with Mizo tili" drop vi and Zahau trI ${ }^{\text {II }} d r o p v i$, as implied in Matisoff (2003:410) and discussed in footnote 299, to be indirect at best; the syllable weight in Mizo and Zahau is also inconsistent.
    ${ }^{397}$ See also Shorto (2006:408). Matisoff (2003:216) suggests an allofamic relationship with * ${ }^{[\varepsilon j}{ }^{[1}$ buy $v t$ which Benedict (1967:321-2) believes to be an Austronesian / TaiKadai loanword.
    ${ }^{398}$ See Stewart \& Dunn (1940-81:348); Thurgood (1981:36) suggests there may be relics of a lost transitivity distinction here.
    ${ }^{399}$ There is one instance of a variant spelling Qx $^{{ }^{h}}{ }^{\text {ran }}$ (WK 3.367), noted by Luce \& Whitbread (1971:212), which, if not due to scribal error, may be attributable to an
    external origin.
     Takashima (2003:II.73-4), is a pictograph of a man atop a tree $\hat{4}$.
    ${ }^{401}$ Lehman suggests an association between ${ }^{\text {K }}$ len ${ }^{\text {I }}$ cart $n$ and ${ }^{*} \log \eta^{\text {II }} /$ lon ${ }^{\text {II }}$ boat $n$ discussed below.

[^141]:    ${ }^{402}$ Specifically bridge $n$ but Mizo and Zahau may be combined with $\mathrm{ka}^{\mathrm{T}}$ and $\mathrm{ka}^{\mathrm{Ta}}$ respectively to mean stairs $n$ ．
    ${ }^{403}$ The $-l$ coda is based on its $x$ iesheng associations but at the time of character composition this may have already shifted to $-j$ ．
    ${ }^{404}$ See the discussion under six $v i$ for an account of the bilabial coda in Thado lop．
    ${ }^{405}$ Matisoff（2003：145）notes $-r$－and $-l$－medials in Intha Burmese，but Okell（1995：59；64）and Nishi（1999：674）note that $-r$－and $-l$－are not contrastive in Intha Burmese． In any case，Okell（1995：66）suggests a liquid medial in the word to be aberrant which is not supported by inscriptional evidence for $-j$ ；－the situation is similar to that of （i̊
    
    
    
    ${ }^{407}$ Matisoff＇s proposal that n $\varepsilon$ ？ qos nak black，deep $v$ is related via dentalisation of the labial initial due to the $s$－prefix is unlikely due to the uniqueness of the case and the
    
     ${ }^{408}$ See also Shorto（2006：206）and note the discussion of mar？$\}$ oros mik dark vi in 2．1．1．
    ${ }^{409}$ Note also h $\varepsilon j^{j}$ 黑 $\mathrm{x} \partial \mathrm{k}<*^{h} \mathrm{~m} \partial \mathrm{k}$ black $v i$ ．Sagart＇s proposal to treat the Burmese form as a Chinese loanword makes no account for the nasalisation of the coda．

[^142]:    434 Pestricted to Zahau．
    ${ }^{435}$ Sagart（1999b：151－2）reconstructs initial＊s－l－via a proposed association with $\mathrm{ts}^{\mathrm{h}} \mathrm{an}^{\mathrm{I}}{ }^{\text {參 }} *{ }^{*} \mathrm{ts}^{\mathrm{h}} \mathrm{m}^{\mathrm{I}}$ triad $n$ which he reconstructs with ${ }^{\prime} s^{h} l^{h}-$－；this is plausible providing the word was loaned to Tibeto－Burman after the shift of the initial to $s$－．
    ${ }^{436}$ Baxter（1992：233）reconstructs＊k－l－on the basis of Coblin＇s observation（1983：156）that the word is used as a Han sound gloss for kry ${ }^{\mathrm{I}}$ 宮 kuwn $\mathrm{I}^{\mathrm{T}}<*^{\prime}$－2m ${ }^{\mathrm{WI}}$ dwelling house，palace $n$ for which Schuessler（2007：256）notes Mon－Khmer evidence supporting a $k-l$－cluster．Notably，Bodman（1980：123）also reconstructs 中 with $* k-l$－on the basis of a possible Tibetan comparandum．
    ${ }^{437}$ This is likely related to Left $n$ below．Note also＊wej＇ swing vt．
    ${ }_{439}^{438}$ See also Shorto（2006：120）．
    ${ }_{440}^{439}$ This is restricted to Mizo，but see also＊wel페－s ring－shaped stand $n$ attested irregularly in Mizo as vel ${ }^{\text {¹ }}$ ．
    ${ }^{440}$ See Shorto（1973：379－81）．
    ${ }^{442}$ See also Shorto（2006：120）．

[^143]:    ${ }^{444}$ See Henderson (1965:84-9), Stern (1963:243-51) and Lehman (1996) for further information.
    ${ }^{445}$ Non-native or onomatopoeic syllables with original obstruent codas in tone I, or IIa in Mizo and Zahau, appear to develop tone III in form 2 without loss of the coda.

[^144]:    ${ }^{446}$ The Zo reflexes in $-a$ from an original rhotic correspond to the preceding vocalism as discussed in 1.4.2.4.
    ${ }^{447}$ Bhaskararao (1994:338) suggests a form 2 ho? for hok ${ }^{\text {II }}$ skin vt but it is recorded regularly as hok ${ }^{\text {III }}$ in the wordlist here.
    ${ }^{448}$ The exceptional word $t^{\text {hi }} \mathrm{k}^{\text {пib }}$ deep $v i$, with a form $2 \mathrm{t}^{\text {h }} \mathrm{uk}^{\text {II }}$, is also irregular in Mizo, Thado and Zo and is clearly external in origin. Matisoff (2003:359) and Peiros \& Starostin (1996:\#994) compare
     source ฉిळ worthy, suitable $v i$ is noted by Luce (1977b:3) to be plausibly Mon or Shan in origin.
    ${ }^{449}$ Hillard's associated proposal that form 2 may therefore be primary is discusssed in 7.1.3.

[^145]:    ${ }^{450}$ Mizo unequivocally attests $-k$ except in ts ${ }^{\mathrm{h}} \mathrm{a}^{\mathrm{nb}} \sim$ ts $^{\mathrm{h}}$ rat ${ }^{\text {tb }}$ ruined, bad $v i$, which is also noted by Hillard (1975:10) to be irregular, and possibly also in $t^{h}{ }^{\mathrm{H}} \mathrm{at}^{\mathrm{rb}} \sim t^{\mathrm{H}} \mathrm{ra}$ ? drop vt of which the form 1 correlates with a derivative of an open vowel in some of the other languages which interestingly show $-t / k$ variation in any case.
     marrow $n$, Sagart (1999a:178, 1999b:67) appears correct in his rejection.

[^146]:    ${ }^{452}$ The word is not attested in Zo; one informant did produce it but it was retracted by others as a Tedim word.

[^147]:    ${ }^{453}$ Löffler's proposal (2002b:129-30) for distinctive tones on short stopped syllables to account for verbs that do not inflect seems unnecessary. Verbs in other categories sometimes do not inflect and the process rather represents the gradual depletion of inflections that, as shown in Hartmann (2002:81), has almost completely disappeared in many southern Chin languages.
    ${ }^{454}$ Löffler (2002b:132) notes this variation exclusively Mizo laterals but attempts no explanation. The following cases may be noted: Mizo tol? / tol $1^{\mathrm{Ib}}$ slide $v i$, $\mathrm{t}^{\mathrm{t}} \mathrm{ol}$ ? $/ \mathrm{t}^{\mathrm{h}} \mathrm{ol}^{\mathrm{Ib}}$ slide $v t$; Mizo $\mathrm{p}^{\mathrm{h}} \mathrm{ul} / / \mathrm{p}^{\mathrm{H}} \mathrm{ul}^{\mathrm{Ib}}$ sprinkle

[^148]:    $v t$; Mizo bel ${ }^{\mathrm{Ib}}$, Zahau bel? stick $v t$; Mizo mol ${ }^{\mathrm{Ib}}$, Laizo mol? forget $v t$; Mizo rol ${ }^{\mathrm{Ib}}$, Tedim gol? stiff vi; Mizo ${ }^{\text {h }}$ noj? murky $v i$, Zahau ${ }^{\text {h }} \mathrm{n}$ jj ${ }^{\text {b }}$ breast, milk $n$ as a nominalisation of murky $v i$; Mizo tsol ${ }^{\mathrm{Lb}}$, Zahau tsol? yeast $n$ for which Tedim tone II suggests external influence. Occasionally a semantic distinction appears to have emerged or the variant forms have been reanalysed via analogy as inflectional derivatives: Mizo pil? peel-off vi, pil ${ }^{\mathrm{Ib}}$ rind $n$; Mizo sojill $\sim \operatorname{soj}$ ? whittle $v t$; Zahau $\mathrm{vej}^{\mathrm{nb}} \sim$ vej? wave vt. ${ }^{455}$ See also the discussion in 7.2.2.

[^149]:    ${ }^{456}$ See the discussion in 7.2.2.
    ${ }^{457}$ Nevertheless there are a few examples in the data-set of Mizo and Zahau maintaining the full paradigm and also cases where Thado, Zo , Tedim and Sizang retain only the further derived form.
    ${ }^{458}$ In a select few cases, such as *tajail clean $v$, Thado, Zo, Tedim and Sizang pattern as Mizo and Zahau in not attesting the derived form 1

[^150]:    ${ }^{459}$ Literally arrive back vi.
    ${ }^{460}$ See Peterson (1998:94-7) for a discussion of this in Lai.
    ${ }^{461}$ This excludes any irregular cases of tone I with obstruent codas; see the discussion in 6.1.
    ${ }^{462}$ This is dependent on the conditioning environments discussed in 7.1.1.
    ${ }^{463}$ The word for broom $n$ actually forms the second part of a compound noun.
    ${ }^{464}$ See the discussion in 7.3 concerning the link between verbal inflections and nominalisation.

[^151]:    ${ }^{465}$ These situations where a secondary grammatical distinction is made between two variant forms of the same inflection are reconstructed in the wordlist as ${ }^{*} \sim p / t / k^{I(f)}-s$ with the variation between tones II and III acknowledging this distinction at the surface level but not as individual forms at the underlying level.
    ${ }^{466}$ Cases like ${ }^{*} \mathrm{kem}^{\mathrm{I}} \sim{ }^{*} \mathrm{kem}^{\text {III }}$ set a trap and ${ }^{*} \mathrm{kem}^{\text {II }}$-s set a trap $v$, where any possible grammatical distinction is completely obscure, are also not noted.
    ${ }^{467}$ The benefactive sense is no longer clear.

[^152]:    ${ }^{468}$ Literally make learn $v t$ hence the benefactive sense.
    
     respectively.
    ${ }^{470}$ The aspirated derivative ${ }^{*} \mathrm{p}^{\mathrm{h}}{ }^{\mathrm{h}}{ }^{\text {II}}{ }^{-}$-s unfurl $v t$ appears to have rendered this derivative intransitive; see 7.4 below regarding the association of aspiration and transitivity.

[^153]:    ${ }^{471}$ Listed in the wordlist under its variant ${ }^{*}$ ro'.
    ${ }^{472}$ Literally $u$ surp to someone else $v t$ hence the benefactive sense.
    ${ }^{473}$ Literally display for $v t$.
    ${ }^{474}$ See *krom ${ }^{\text {I }}$ borrow $v$ t.

[^154]:    ${ }^{475}$ Mizo also has lom ${ }^{\text {nb }}$ warm $v t$.
    ${ }^{476}$ The noun men" dream $n$ is attested in all six languages.
    ${ }^{477}$ This also means listen $v t$ in Thado, Zo and Tedim; Mizo makes a secondary semantic distinction with $\mathfrak{y a j}{ }^{\mathbf{I}}$ - $\sim$ ypji- listen $v t$ not reflecting the original form 2 najil. The two glosses love $v t$ and listen $v t$ seem to be connected by a meaning pay close attention $v t$. Matisoff's comparison (1985a:43) of ai ${ }^{I T}$ 愛 $_{2 j j^{\text {ilt }}}<*$ ? $2 t^{\text {II }}$ love $v t$ is based on a superficial modern phonological correspondence.
    ${ }^{478}$ Note also Zahau zrr? teach $v t$.

[^155]:    ${ }^{499}$ Perhaps also confusion with $\mathrm{xam}^{\mathrm{mI}} \sim$ xap pillow $v t$ so should be included in other section
    ${ }^{480}$ Zo makes a secondary grammatical distinction between $\operatorname{lam}^{1} \sim \operatorname{lam}^{\text {II }}$ dance $v i$ and lam ${ }^{1} \sim \operatorname{lep}$ float vi.
    ${ }^{481}$ Zahau has men ${ }^{1}$ catch $u p$ with $v t$, the vocalic ablaut of $\varepsilon / a$ and $\varepsilon / e$ will be discussed in 7.5.2.1.

[^156]:    ${ }^{482}$ Another example may be found in the Thado and Zo reflexes of *ssak ${ }^{\text {II }}$ cockspur $n$ as sett ${ }^{\text {II }}$ and sizt ${ }^{\text {II }}$ respectively.

[^157]:    ${ }^{483}$ See French (1983:336).

[^158]:    ${ }^{484}$ The transitivity distinction appears to have been lost in favour of a semantic one.

[^159]:    ${ }^{485}$ The transitivity distinction appears to have been lost.
    ${ }^{486}$ Matisoff also posits allofamy within one language; see left $n$ in 6.5.4.

[^160]:    ${ }^{487}$ The initial aspiration is regularly lost outside of Mizo and Zahau and is of no significance here.
    ${ }^{488}$ Benedict (1988a:259-60) suggests an alternative link with Mizo nem ${ }^{1}$ soft vi but the vocalism does not correspond.
    ${ }^{489}$ See also the discussion of Zo, Tedim and Sizang $\operatorname{Ip}$ bag $n$ in 5.2.5.1 and Mizo bop hind-leg $n$ under Swell (\#55). Perhaps also of note is the Tedim form 2 inflection dep of dam ${ }^{\text {II }}$ shaded $v i$ which is homophonous with dep cold (weather) vi in Zahau, Thado, Zo and Sizang.
    ${ }^{490}$ Benedict (1991:19) suggests there may be a correlation between tone I with intransitivity and tone II with transitivity but does not note the tone III form and his supporting evidence is not strong.

[^161]:    ${ }^{491}$ Burling (2004:80-1) further notes that speakers are generally consistent for each word but that individual idiosyncracy also plays a role.
    ${ }_{492}$ See the discussion in the introduction to Chapter 5.

[^162]:    ${ }^{493}$ Zahau has *nem ${ }^{\text {" }}$ soft area between the hips and ribs $n$ which is reflected in tone I elsewhere but this is possibly a tone II nominal derivation; Peiros \& Starostin (1996:\#568) compare nã ${ }^{1}$ nam $^{1}$ flank $n$, which Sagart (2004:71) convincingly associates with nan ${ }^{\text {lb }}$ 南 nom $^{\mathrm{I}}<$ *nəm $^{\mathrm{I}}$ south $n$, but the Northern Chin vocalism is discrepant.
    
    
     Pali/Sanskrit loanword ner? $\& \delta$ nic low, inferior, humble vi, identified by Hla Pe ( $1960: 83$ ), is noted by Stewart \& Dunn (1940-81:198;200) to have been respelled as nen? $\$ 8$ nip which they further associate with neill may also be possible here.

[^163]:    ${ }^{495}$ This is to be kept distinct from the regular lowering of $a$ to $a$ between Sino-Tibetan and TibetoBurman when not affected by labializing or palatalizing elements.
    ${ }^{496}$ Pulleyblank (1986a:9, 1989:8-14) proposes the $a$ vowel to be a result of infixation; this will be discussed further in 8.2.3.
    ${ }^{497}$ A similar criticism may be made of Miller's proposal (1958) for a Tibeto-Burman infix system; see the comments by Benedict (1972a:124).
    ${ }^{498}$ Pulleyblank believes the Tibetan verbal alternations represent this primitive ablaut; this is also argued by Miller (1956:44-7). The lack of verbal inflections elsewhere, except in Chin where it has no such effect on vocalism, leads Matisoff (2003:493) to treat view them as a Tibetan peculiarity that cannot be reconstructed back to Tibeto-Burman. Pulleyblank's proposal has also been rejected by Róna-Tas (1985:178-179) on more specific morphological grounds due to it often requiring his derived forms to be treated as the root forms and vice-versa. Pulleyblank (1965a:234) does actually address this issue with the argument that the derived form could become lexically encoded to no longer appear

[^164]:    derived. A comparison may be drawn here with the Northern Chin verbal inflections in spite of their different processes of inflection, but the issues addressed here are beyond the scope of this work.
    ${ }^{499}$ Matisoff (2003:507-8) attempts another comparison with the anomalous Burmese $t j$-combination in
    

[^165]:    with Northern Chin *tek real vi, right-side $n$; Nishi's rejection $(1974: 19 ; 43)$ of the validity of this Burmese comparison is discussed in 2.3.1.4.
    ${ }^{500}$ Schuessler (2003:43) proposes an external source for this.
     with tone II to be original. There is also an irregular tonal correspondence in ${ }^{* p e j}{ }^{1} / \mathrm{pej}$ " go $v i$ and a plausible association between tsel $^{1} /$ tsel ${ }^{1}$ male $n{ }^{*}$ tsel $^{1} /$ tsel ${ }^{1}$ forehead $n$. In addition to the two cases discussed in footnote 348 , there are a few other tonally differentiated semantic alternations in the word list which sometimes also show differences in syllabic weight: *ban' ${ }^{\text {I }}$ arm $n$, *ban ${ }^{\text {" }}$ reach for $v t$; *ral ${ }^{1}$
    
     $\nu i$.
    ${ }_{502}$ See the specific entries in the word list for further examples.

[^166]:    ${ }^{503}$ Matisoff (2000a:141-2) assigns a meaning belly $n$ rather than load to the first syllable of an old Mizo word von" ${ }^{\text {II }}$ or ${ }^{\text {' }}$ have diarrhoea $v i$, but his comparison of Burmese wũ ${ }^{\text {II }}$ os: wam ${ }^{\text {I }}$ belly $n$ does not concur in rhyme or tone. The Mizo compound may nonetheless be a loan from Burmese wü̃ $\int 0^{11}$ os:ocogp have diarrhoea vi.

[^167]:    ${ }^{504}$ This alternation only occurs in the nominal form 2 Laizo derivative $\mathrm{zIn}{ }^{\text {II }}$.
    ${ }^{505}$ This alternation only occurs in the nominal form 2 derivative ${ }^{*} \mathrm{woj}^{\mathrm{II}} / \mathrm{w}^{\mathrm{II}}{ }^{\mathrm{II}}$.
    ${ }^{506}$ See the specific entries in the word list for further examples.

[^168]:    ${ }^{507}$ The cases of vowel ablaut discussed in 7.5 .2 will not be discussed any further here, suffice to say that the complex situation appears to be a combination of regular Neogrammarian sound shifts, phonoaesthetics, borrowing and analogy; the case of analogy as it relates to lexical diffusion will be discussed in 8.1.2 below.

[^169]:    ${ }^{508}$ Pulleyblank's suggestion (1973b:371) that the sporadic process of change of Old Chinese -s to Middle Chinese $-h$ was conditioned by the rhymes involved is in accordance with the Neogrammarian hypothesis; the variability suggests this not to be the case in Northern Chin although grammatical conditioning may have been an influence.

[^170]:    ${ }^{509}$ See Kuipers (1968:78-80) for a criticism of Szemerényi's position.
    ${ }^{510}$ Note also the observation in 1.4.1 that the distinction between sonorant consonants and vowels in Northern Chin is blurred.
    ${ }^{511}$ Pulleyblank (1993b:83) notes solid evidence in the evolution of Chinese.

[^171]:    ${ }^{512}$ Crothers' analysis is also noted by Villar (1993:157-8) whose preference (1993:144) for treating $i$ and $u$ as vowel phonemes, regardless of their different function from $e$ and $a$, leaves him no typological grounds for favouring any vocalic system other than $i, u, e, a$.

[^172]:    ${ }^{513}$ According to Kuipers (1976:108-9), the issue of juncture does not concern Abaza. Nonetheless, Halle (1970:101) is able to levels the same criticisms regarding stress.
    ${ }^{514}$ Kuipers' response (1968:77) suggests that in this case he has not fully grasped the significance of Szemerényi's point.
    ${ }_{515}$ A fundamental difference between Kuipers' and Pulleyblank's analyses is that Pulleyblank (1998a:5-13) does actually posit a syllabic glide phoneme $a$, corresponding to $a$ in the same way $j$ and $w$ corresponds to $i$ and $u$, while Kuipers' does not need to appeal to such a recourse in Kabardian.

[^173]:    ${ }^{1}$ Mi flame vi/n, Ka flame vi; Th/Te red-hot vi; Ko whiteness on red-hot charcoal n; Si red-hot vi.
    ${ }^{2} \mathrm{Mi} / \mathrm{Za}$ vegetable $n ; \mathrm{Th} / \mathrm{Zo} / \mathrm{Te} / \mathrm{Si}$ food $n$.
    ${ }^{3} \mathrm{Zo}$ and Tedim tone III is due to sandhi
    ${ }^{3} \mathrm{Zo}$ and Tedim tone III is due to sandhi.
    ${ }^{5}$ Thado has $\mathrm{em}^{\mathrm{I}} \sim \mathrm{em}^{\text {III }}$ glow (as lump of charcoal) vi.

[^174]:    ${ }^{21}$ Mi look-after (child, elderly) vt; $\mathrm{Za} / \mathrm{Th} / \mathrm{Zo} / \mathrm{Te}$ serve tea $v t$; Si look-after (child), serve tea vt. Sizang has om ${ }^{\mathrm{I}} \sim \mathrm{om}^{\text {II }}$ look after (specifically outside of house) vt. ${ }^{22}$ Th brood vi, chest $n$. Wo has op ${ }^{\text {II }}$ chest $n$.
